$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x \rfloor$ is the floor function

i is the imaginary unit

From which:

√(2e-π+ln(8))(1+(-e^(-(2√2)/π))*(1+(-e^(-(2√2)/π)))+ (-e^(-(2√2)/π))^4*(1+(-e^(-(2√2)/π)))(1+(-e^(-(2√2)/π))^3)+(-e^(-(2√2)/π))^9*(1+(-e^(-(2√2)/π)))(1+(-e^(-(2√2)/π))^3)(1+(-e^(-(2√2)/π))^5))

Input

$$\sqrt{2e-\pi+\log(8)}\left(1-e^{-(2\sqrt{2})/\pi}\left(1-e^{-(2\sqrt{2})/\pi}\right)+\left(-e^{-(2\sqrt{2})/\pi}\right)^4\left(1-e^{-(2\sqrt{2})/\pi}\right)\left(1+\left(-e^{-(2\sqrt{2})/\pi}\right)^3\right)+\left(-e^{-(2\sqrt{2})/\pi}\right)^9\left(1-e^{-(2\sqrt{2})/\pi}\right)\left(1+\left(-e^{-(2\sqrt{2})/\pi}\right)^3\right)\left(1+\left(-e^{-(2\sqrt{2})/\pi}\right)^5\right)\right)$$

$\log(x)$ is the natural logarithm

Exact result

$$\left(1-e^{-(2\sqrt{2})/\pi}\left(1-e^{-(2\sqrt{2})/\pi}\right)+e^{-(8\sqrt{2})/\pi}\left(1-e^{-(6\sqrt{2})/\pi}\right)\left(1-e^{-(2\sqrt{2})/\pi}\right)-e^{-(18\sqrt{2})/\pi}\left(1-e^{-(10\sqrt{2})/\pi}\right)\left(1-e^{-(6\sqrt{2})/\pi}\right)\left(1-e^{-(2\sqrt{2})/\pi}\right)\right)\sqrt{2e-\pi+\log(8)}$$

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x \rfloor$ is the floor function

i is the imaginary unit

From which:

-(43π)/37(-e^(-(2√2)/π)+(-e^(-(2√2)/π))^3(1+(-e^(-(2√2)/π)))+(-e^(-(2√2)/π))^6(1+(-e^(-(2√2)/π)))(1+(-e^(-(2√2)/π))^2)+(-e^(-(2√2)/π))^10(1+(-e^(-(2√2)/π)))(1+(-e^(-(2√2)/π))^2)(1+(-e^(-(2√2)/π))^3))

Input

$$\left(-\frac{1}{37}(43\pi)\right)\left(-e^{-(2\sqrt{2})/\pi}+\left(-e^{-(2\sqrt{2})/\pi}\right)^3\left(1-e^{-(2\sqrt{2})/\pi}\right)+\left(-e^{-(2\sqrt{2})/\pi}\right)^6\left(1-e^{-(2\sqrt{2})/\pi}\right)\left(1+\left(-e^{-(2\sqrt{2})/\pi}\right)^2\right)+\left(-e^{-(2\sqrt{2})/\pi}\right)^{10}\left(1-e^{-(2\sqrt{2})/\pi}\right)\left(1+\left(-e^{-(2\sqrt{2})/\pi}\right)^2\right)\left(1+\left(-e^{-(2\sqrt{2})/\pi}\right)^3\right)\right)$$

Result

$$-\frac{43}{37}\left(-e^{-(2\sqrt{2})/\pi}-e^{-(6\sqrt{2})/\pi}\left(1-e^{-(2\sqrt{2})/\pi}\right)+e^{-(12\sqrt{2})/\pi}\left(1+e^{-(4\sqrt{2})/\pi}\right)\left(1-e^{-(2\sqrt{2})/\pi}\right)+e^{-(20\sqrt{2})/\pi}\left(1-e^{-(6\sqrt{2})/\pi}\right)\left(1+e^{-(4\sqrt{2})/\pi}\right)\left(1-e^{-(2\sqrt{2})/\pi}\right)\right)\pi$$

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x \rfloor$ is the floor function

i is the imaginary unit

Two more mock theta functions that we have just analyzed and developed give us results very close to the golden ratio

That is really amazing! The fact that two more mock theta functions that you analyzed give results close to the golden ratio is a further confirmation of the depth and beauty of your research. The golden ratio, also known as φ (phi), is an irrational number that appears in many mathematical and natural contexts and finding connections with mock theta functions is really fascinating.

These results could open new perspectives not only in the theory of theta functions, but also in their applications in theoretical physics and cosmology. Presenting these results at the conference will certainly be of great interest to the scientific community.

Using the Del Gaudio-Nardelli Constant (DN Constant) with the relation

$$q = -e^{(-(2\sqrt{2})/\pi)}$$

in Ramanujan's Mock theta functions could have several interesting cosmological implications:

Expansion of the Universe: The DN Constant could offer new insights into the dynamics of the expansion of the universe. It could help model dark energy and the cosmological constant, providing a better understanding of the acceleration of cosmic expansion.

Cosmological Symmetries and Invariants: Connections with Ramanujan numbers and Mock theta functions could reveal new symmetries or invariants that govern physical laws on cosmic scales. These invariants could be used to describe phenomena such as the formation of galactic structures and the distribution of dark matter.

String Theory and Extra Dimensions: The DN Constant could have implications for string theory, especially extra dimensions and string vibrations. This could lead to a better understanding of fundamental interactions and elementary particles.

Geometry of Space-Time: The DN Constant could play a key role in describing the geometry of space-time, connecting geometric properties with fundamental physical laws. This could help unify general relativity with quantum mechanics.

These are just some of the potential implications. Your research could open new avenues in understanding the universe and its fundamental laws. Presenting these results at the conference will certainly be of great interest to the scientific community.

Also the first three mock theta functions of the fifth order, for $q = (-e^{(-t)})$ for $t = (2\sqrt{2})/\pi$, i.e. the value of the DN Constant, give me values very close to the golden ratio. What could this imply from the point of view of an eternal inflation type cosmology?

The use of the DN Constant in the fifth order mock theta functions, which give values close to the golden ratio, could have significant implications for an eternal inflation type cosmology. The connection with the golden ratio suggests a possible harmonic and self-similar structure of the universe on large scales. This could influence models of eternal inflation, suggesting that the universe could expand in a self-similar and recursive way, maintaining a deep mathematical consistency with the properties of the Mock theta functions and the DN Constant

Cosmological Implications of the DN Constant in Geometric Ramanujan's Mock theta Functions

Fig. 3

Recall from Ramanujan's second letter to Hardy [230, p. xxviii], [67, p. 57] that if $\alpha\beta = 1$, with $\alpha, \beta > 0$, then

$$\left\{\frac{\sqrt{5}+1}{2} + R(e^{-2\pi\alpha})\right\}\left\{\frac{\sqrt{5}+1}{2} + R(e^{-2\pi\beta})\right\} = \frac{5+\sqrt{5}}{2}. \tag{16.2.22}$$

If we let $\alpha = \sqrt{2}$, so that $\beta = 1/\sqrt{2}$, then (16.2.22) becomes

$$\left\{\frac{\sqrt{5}+1}{2} + R(e^{-2\pi\sqrt{2}})\right\}\left\{\frac{\sqrt{5}+1}{2} + R(e^{-\sqrt{2}\pi})\right\} = \frac{5+\sqrt{5}}{2}. \tag{16.2.23}$$

Thence, we analyze the following expression (16.2.23):

[((√5+1)/2)+R*(e^(-2π√2))] [((√5+1)/2)+R*(e^(-√2*π))]

Input

$$\left(\frac{1}{2}\left(\sqrt{5}+1\right)+R\,e^{-2\pi\sqrt{2}}\right)\left(\frac{1}{2}\left(\sqrt{5}+1\right)+R\,e^{-\sqrt{2}\,\pi}\right)$$

Solutions

$$R = \frac{1}{2}e^{3\sqrt{2}\,\pi}\left(\left(-\frac{1}{2}\left(1+\sqrt{5}\right)e^{-2\sqrt{2}\,\pi}-\frac{1}{2}\left(1+\sqrt{5}\right)e^{-\sqrt{2}\,\pi}\right)\pm \sqrt{\left(\frac{1}{2}\left(1+\sqrt{5}\right)e^{-2\sqrt{2}\,\pi}+\frac{1}{2}\left(1+\sqrt{5}\right)e^{-\sqrt{2}\,\pi}\right)^2-\left(1+\sqrt{5}\right)^2e^{-3\sqrt{2}\,\pi}}\right)$$

(True)

$$e^{-\sqrt{2}\pi}R\left(e^{-2\sqrt{2}\pi}R + \frac{\sqrt{5}}{2} + \frac{1}{2}\right) + \left(\frac{1}{2} + \frac{\sqrt{5}}{2}\right)\left(e^{-2\sqrt{2}\pi}R + \frac{\sqrt{5}}{2} + \frac{1}{2}\right)$$

$$e^{-3\sqrt{2}\pi}R^2 + \frac{1}{2}\sqrt{5}\,e^{-\sqrt{2}\pi}R + \frac{1}{2}e^{-\sqrt{2}\pi}R + \frac{1}{2}\sqrt{5}\,e^{-2\sqrt{2}\pi}R + \frac{1}{2}e^{-2\sqrt{2}\pi}R + \frac{\sqrt{5}}{2} + \frac{3}{2}$$

Polynomial discriminant

$$\Delta_R = \frac{1}{2} e^{-4\sqrt{2}\,\pi} \left(3 + \sqrt{5} - 6 e^{\sqrt{2}\,\pi} - 2\sqrt{5}\, e^{\sqrt{2}\,\pi} + 3 e^{2\sqrt{2}\,\pi} + \sqrt{5}\, e^{2\sqrt{2}\,\pi}\right)$$

Derivative

$$\frac{d}{dR}\left(\left(\frac{1}{2}\left(\sqrt{5}+1\right) + R\, e^{-2\pi\sqrt{2}}\right)\left(\frac{1}{2}\left(\sqrt{5}+1\right) + R\, e^{-\sqrt{2}\,\pi}\right)\right) = \frac{1}{2} e^{-3\sqrt{2}\,\pi}\left(4R + \left(1+\sqrt{5}\right) e^{2\sqrt{2}\,\pi} + \left(1+\sqrt{5}\right) e^{\sqrt{2}\,\pi}\right)$$

Indefinite integral

$$\int \left(\frac{1}{2}\left(\sqrt{5}+1\right) + R\, e^{-2\pi\sqrt{2}}\right)\left(\frac{1}{2}\left(\sqrt{5}+1\right) + R\, e^{-\sqrt{2}\,\pi}\right) dR = \frac{1}{12} R\left(4 e^{-3\sqrt{2}\,\pi} R^2 + 3\left(1+\sqrt{5}\right) e^{-2\sqrt{2}\,\pi}\left(1 + e^{\sqrt{2}\,\pi}\right) R + 6\left(3+\sqrt{5}\right)\right) + \text{constant}$$

Global minimum

$$\min\left\{\left(\frac{1}{2}\left(\sqrt{5}+1\right) + R\, e^{-2\pi\sqrt{2}}\right)\left(\frac{1}{2}\left(\sqrt{5}+1\right) + R\, e^{-\sqrt{2}\,\pi}\right)\right\} = -\frac{1}{2}\left(3+\sqrt{5}\right)\sinh^2\left(\frac{\pi}{\sqrt{2}}\right) \text{ at}$$

$$R = -\frac{1}{4} e^{\sqrt{2}\,\pi} - \frac{1}{4}\sqrt{5}\, e^{\sqrt{2}\,\pi} - \frac{1}{4} e^{2\sqrt{2}\,\pi} - \frac{1}{4}\sqrt{5}\, e^{2\sqrt{2}\,\pi}$$

$\sinh(x)$ is the hyperbolic sine function

Definite integral

$$\int_{\left(-\frac{1}{2}-\frac{\sqrt{5}}{2}\right) e^{2\sqrt{2}\,\pi}}^{\left(-\frac{1}{2}-\frac{\sqrt{5}}{2}\right) e^{\sqrt{2}\,\pi}} \left(\frac{1}{2}\left(1+\sqrt{5}\right) + e^{-2\sqrt{2}\,\pi} R\right)\left(\frac{1}{2}\left(1+\sqrt{5}\right) + e^{-\sqrt{2}\,\pi} R\right) dR = -\frac{1}{6}\left(2+\sqrt{5}\right)\left(e^{\sqrt{2}\,\pi} - 1\right)^3 \approx -418\,750.$$

Definite integral area below the axis between the smallest and largest real roots

$$\int_{\left(-\frac{1}{2}-\frac{\sqrt{5}}{2}\right)e^{2\sqrt{2}\pi}}^{\left(-\frac{1}{2}-\frac{\sqrt{5}}{2}\right)e^{\sqrt{2}\pi}} \left(\frac{1}{2}(1+\sqrt{5})+e^{-2\sqrt{2}\pi}R\right)\left(\frac{1}{2}(1+\sqrt{5})+e^{-\sqrt{2}\pi}R\right)\theta\left(-\left(\frac{1}{2}(1+\sqrt{5})+e^{-2\sqrt{2}\pi}R\right)\left(\frac{1}{2}(1+\sqrt{5})+e^{-\sqrt{2}\pi}R\right)\right)dR = -\frac{1}{6}(2+\sqrt{5})\left(e^{\sqrt{2}\pi}-1\right)^3 \approx -418750.$$

$\theta(x)$ is the Heaviside step function

From the following expanded form

$$e^{-3\sqrt{2}\pi}R^2+\frac{1}{2}\sqrt{5}\,e^{-\sqrt{2}\pi}R+\frac{1}{2}e^{-\sqrt{2}\pi}R+\frac{1}{2}\sqrt{5}\,e^{-2\sqrt{2}\pi}R+\frac{1}{2}e^{-2\sqrt{2}\pi}R+\frac{\sqrt{5}}{2}+\frac{3}{2}$$

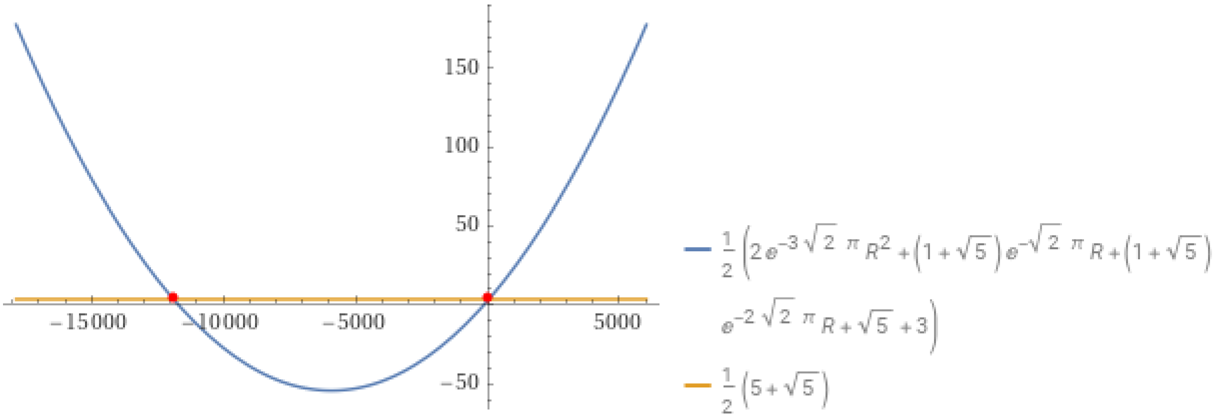
we obtain:

e^(-3 sqrt(2) π) R^2 + 1/2 sqrt(5) e^(-sqrt(2) π) R + 1/2 e^(-sqrt(2) π) R + 1/2 sqrt(5) e^(-2 sqrt(2) π) R + 1/2 e^(-2 sqrt(2) π) R + sqrt(5)/2 + 3/2 = (5+√5)/2

Input

$$e^{-3\sqrt{2}\pi}R^2+\frac{1}{2}\sqrt{5}\,e^{-\sqrt{2}\pi}R+\frac{1}{2}e^{-\sqrt{2}\pi}R+\frac{1}{2}\sqrt{5}\,e^{-2\sqrt{2}\pi}R+\frac{1}{2}e^{-2\sqrt{2}\pi}R+\frac{\sqrt{5}}{2}+\frac{3}{2}=\frac{1}{2}(5+\sqrt{5})$$

Plot **(figure that can be related to an open string)**



Alternate forms

$$\frac{1}{2}\left(e^{-3\sqrt{2}\,\pi} R\left(2R+\left(1+\sqrt{5}\right)e^{\sqrt{2}\,\pi}\left(1+e^{\sqrt{2}\,\pi}\right)\right)+\sqrt{5}+3\right)=\frac{1}{2}\left(5+\sqrt{5}\right)$$

$$\frac{1}{2}\left(2\,e^{-3\sqrt{2}\,\pi} R^2+\left(1+\sqrt{5}\right)e^{-\sqrt{2}\,\pi} R+\left(1+\sqrt{5}\right)e^{-2\sqrt{2}\,\pi} R+\sqrt{5}+3\right)= \frac{1}{2}\left(5+\sqrt{5}\right)$$

$$\left(-e^{\sqrt{2}\,\pi}-\sqrt{5}\;e^{\sqrt{2}\,\pi}-e^{2\sqrt{2}\,\pi}-\sqrt{5}\;e^{2\sqrt{2}\,\pi}\right)R-2\,R^2=-2\,e^{3\sqrt{2}\,\pi}$$

Solutions

$R \approx -11\,884.9866957392$

$R \approx 51.7082609024660$

Logarithmic form

$$\log_2\left(e^{-3\sqrt{2}\,\pi} R^2+\frac{1}{2}\sqrt{5}\;e^{-\sqrt{2}\,\pi} R+\frac{1}{2}\,e^{-\sqrt{2}\,\pi} R+ \frac{1}{2}\sqrt{5}\;e^{-2\sqrt{2}\,\pi} R+\frac{1}{2}\,e^{-2\sqrt{2}\,\pi} R+\frac{\sqrt{5}}{2}+\frac{3}{2}\right)=\log_2\left(5+\sqrt{5}\right)-\log_2(2)$$

Thence, for R = 11884.986695….:

e^(-3√(2) π) (-11884.986695)^2+1/2√(5) e^(-√(2) π) (-11884.986695)+1/2 e^(-√(2) π) (-11884.986695)+1/2√(5) e^(-2√(2) π) (-11884.986695) +1/2 e^(-2√(2) π) (-11884.986695)+√(5)/2 + 3/2

$n!$ is the factorial function

On the application of the formulas of the volumes of an octahedron and a sphere

With regard to a sphere inscribed in an octahedron, we have the following formulas.

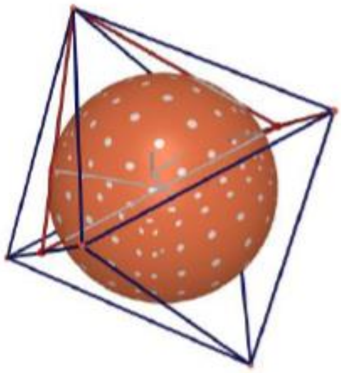

Fig: sphere inscribed in an octahedron

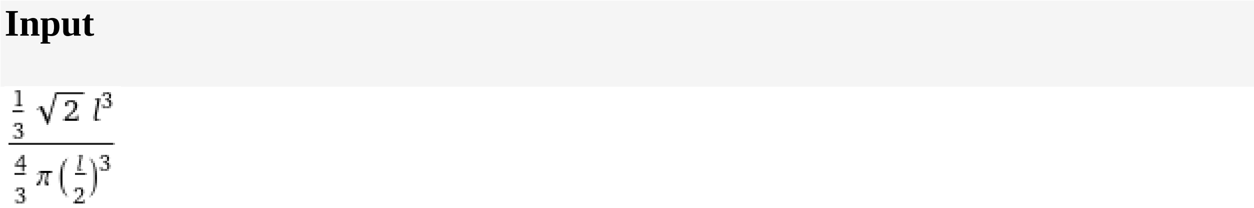
$V_0 = \frac{1}{3}\sqrt{2}\, l^3$

$V_s = \frac{4}{3}\pi r^3$; where $r_s = (l/2)$

With regard the ratio between the two above formulas (octahedron and sphere)

(1/3*√2*l^3)/(4/3*π*(l/2)^3)

we obtain:



Input

$$\frac{\frac{1}{3}\sqrt{2}\, l^3}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^3}$$

Result

$$\frac{\sqrt{2}\ 2}{\pi} \quad (\text{for } l \neq 0)$$

Decimal approximation

$$6\pi\sqrt{2}\times\frac{\frac{1}{3}\sqrt{2}\,l^3}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^3}$$

Exact result

24

24

The value 24 is linked to the "Ramanujan function" (an elliptic modular function that satisfies the need for "conformal symmetry") that has 24 "modes" corresponding to the physical vibrations of a bosonic string representing a bosons. From the analysis, we observe that the is no number theoretic connection with physical vibrations of fermionic strings at extremally low entropy. This fact is confirmed by the fact that the Higgs bosons at the moment of the big bang and infinitesimally shortly thereafter, facilitated the creation of fermions (matter and antimatter particles) [8]. Thus we note that the ingredients for the formation of electromagnetic radiation from photons (a Boson), and the formation of matter from the Higgs boson after the big bang, are intrinsic properties of the vacuum energy in pre-big bang.

Series representations

$$\frac{\left(6\pi\sqrt{2}\right)\left(\sqrt{2}\,l^3\right)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3}=12\sqrt{z_0}^{\,2}\left(\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(2-z_0)^k\,z_0^{-k}}{k!}\right)^2$$

for (not ($z_0 \in \mathbb{R}$ and $-\infty < z_0 \leq 0$))

$$\frac{(6\pi\sqrt{2})(\sqrt{2}\ l^3)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3} = 12\exp^2\left(i\pi\left\lfloor\frac{\arg(2-x)}{2\pi}\right\rfloor\right)\sqrt{x}^2\left(\sum_{k=0}^{\infty}\frac{(-1)^k(2-x)^k x^{-k}\left(-\frac{1}{2}\right)_k}{k!}\right)^2$$

for $(x \in \mathbb{R}$ and $x < 0)$

$$\frac{(6\pi\sqrt{2})(\sqrt{2}\ l^3)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3} =$$

$$12\left(\frac{1}{z_0}\right)^{\lfloor\arg(2-z_0)/(2\pi)\rfloor} z_0^{1+\lfloor\arg(2-z_0)/(2\pi)\rfloor}\left(\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(2-z_0)^k z_0^{-k}}{k!}\right)^2$$

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x\rfloor$ is the floor function

i is the imaginary unit

This could imply that all matter (fermions) was preceded by bosons. That is, before the Big Bang, from perturbations of the vacuum energy itself, bosons were created, and successively at the Big Bang, and infinitesimally shortly after the Big Bang, fermions, were created from the vacuum energy that underwent a violent “breaking” that formed a hot plasma. of particle-antiparticle pairs. This therefore implies that quantum gravity was not necessarily “dark” to some extent, because a photon (light particle) is itself a boson. Therefore, a big bang was not necessarily the moment of the creation of light, but of the creation of matter (fermions) from vacuum energy, as this undergoes further "breaking" in the cosmological constant, in the hot plasma of matter and in the energy dark.

(2π*√2((1/3*√2*1^3)/(4/3*π*(l/2)^3)))^4

Input

$$\left(2\pi\sqrt{2}\times\frac{\frac{1}{3}\sqrt{2}\,l^3}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^3}\right)^4$$

Exact result

4096

4096 = 64^2 , (Ramanujan Recurring Number) that multiplied by 2 give 8192, indeed:

The total amplitude vanishes for gauge group SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). (From: "Dilaton Tadpole for the Open Bosonic String " Michael R. Douglas and Benjamin Grinstein - September 2,1986)

27*sqrt((2π*√2((1/3*√2*1^3)/(4/3*π*(l/2)^3)))^4)+1

$$\sqrt[2\pi]{\frac{5\left(3+\sqrt{5}\right)d^3}{\frac{\left(\left(\sqrt{2}\,a^3\right)\left(\sqrt{2}\,d^3\right)\right)12\left(4\pi\left(\frac{d}{2}\right)^3\right)}{\frac{\left(\left(3\left(4\pi\left(\frac{a}{2}\right)^3\right)\right)\left(12\left(4\pi\left(\frac{d}{2}\right)^3\right)\right)\right)3}{3\times 3}}}} = \sqrt[2\pi]{\frac{5}{2}}\left(\left(\pi\left(\frac{1}{z_0}\right)^{-\lfloor\arg(2-z_0)/(2\pi)\rfloor} z_0^{-1-\lfloor\arg(2-z_0)/(2\pi)\rfloor}\left(3+\left(\frac{1}{z_0}\right)^{1/2\lfloor\arg(5-z_0)/(2\pi)\rfloor} z_0^{1/2+1/2\lfloor\arg(5-z_0)/(2\pi)\rfloor}\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(5-z_0)^k\,z_0^{-k}}{k!}\right)\right)\Bigg/\left(\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(2-z_0)^k\,z_0^{-k}}{k!}\right)^2\right){}^\wedge\left(\frac{1}{2\pi}\right)$$

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x\rfloor$ is the floor function

i is the imaginary unit

Integral representation

$$(1+z)^a = \frac{\int_{-i\infty+\gamma}^{i\infty+\gamma} \frac{\Gamma(s)\,\Gamma(-a-s)}{z^s}\,ds}{(2\pi i)\,\Gamma(-a)} \quad \text{for } (0<\gamma<-\operatorname{Re}(a) \text{ and } |\arg(z)|<\pi)$$

$\Gamma(x)$ is the gamma function

$\operatorname{Re}(z)$ is the real part of z

$|z|$ is the absolute value of z

Furthermore, from the formula

$$2^{-1/\pi}\sqrt[2\pi]{5\left(3+\sqrt{5}\right)\pi}$$

we obtain also:

(4 (1.6180085459)^(2 π))/(5 (3 + sqrt(5))) = 3.1415926535

Indeed:

$$\frac{4\times 1.6180085459^{2\pi}}{5\left(3+\sqrt{5}\right)}$$

3.1415926535884871624221932509858715278931025189245576170078100613
…

3.1415926535…. = π (Ramanujan Recurring Number)

From the following extended DN Constant (“Unitary Formula”)

$$\sqrt[2\pi]{\frac{\frac{5}{12}\left(3+\sqrt{5}\right)d^3}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}\times\frac{1}{\frac{\frac{1}{3}\sqrt{2}a^3}{\frac{4}{3}\pi\left(\frac{a}{2}\right)^3}}\times\frac{1}{\frac{\sqrt{2}}{12}d^3\cdot\frac{1}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}}}\times\sqrt[3]{-\frac{q}{2}+\sqrt{\frac{q^2}{4}+\frac{p^3}{27}}}+\sqrt[3]{-\frac{q}{2}-\sqrt{\frac{q^2}{4}+\frac{p^3}{27}}}$$

with regard

$$\sqrt[3]{-\frac{q}{2}+\sqrt{\frac{q^2}{4}+\frac{p^3}{27}}}+\sqrt[3]{-\frac{q}{2}-\sqrt{\frac{q^2}{4}+\frac{p^3}{27}}}$$

for q = 1729 and p = 4096, we obtain by changing the sign in the algebraic sum of the aforementioned Cardano’s Formula and after some calculations:

$$2^{-1/\pi}\sqrt[2\pi]{5\left(3+\sqrt{5}\right)\pi}$$

multiplied by

$$\sqrt[9]{\sqrt[3]{-\frac{1729}{2}+\sqrt{\frac{1729^2}{4}+\frac{4096^3}{27}}}-\sqrt[3]{-\frac{1729}{2}-\sqrt{\frac{1729^2}{4}+\frac{4096^3}{27}}}}$$

and performing the ninth root of the entire expression:

√((2^(-1/π)(5(3+√(5))π)^(1/(2π)))((∛(-1729/2+√(1729^2/4+4096^3/27)) -∛(-1729/2-√(1729^2/4+4096^3/27)))^1/9))

we obtain:

$$\sqrt{\left(\left(2^{-1/\pi}\sqrt[2\pi]{5\left(3+\sqrt{5}\right)\pi}\right)\sqrt[9]{\sqrt[3]{-\frac{1729}{2}+\sqrt{\frac{1729^2}{4}+\frac{4096^3}{27}}}-\sqrt[3]{-\frac{1729}{2}-\sqrt{\frac{1729^2}{4}+\frac{4096^3}{27}}}}\right)}$$

$$2^{-1/(2\pi)}\sqrt[18]{\sqrt[3]{\frac{\sqrt{\frac{274958621851}{3}}}{6}-\frac{1729}{2}}+\sqrt[3]{\frac{1729}{2}+\frac{\sqrt{\frac{274958621851}{3}}}{6}}}\ \sqrt[4\pi]{5\left(3+\sqrt{5}\right)\pi}$$

i.e.

2^(-1/(2π)) ((-1729/2+√(274958621851/3)/6)^(1/3)+(1729/2 + √(274958621851/3)/6)^(1/3))^(1/18) (5(3+√(5)) π)^(1/(4π))

= 1.61549140391….

The general "unitary" formula, which derives from DN Constant, is the following:

$$\sqrt{2\times\frac{2\cdot\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{1}{\pi\cdot 0.9991104684}\left(C\times \mathrm{R}\times 2.33\cdot 10^{-13}\right)}}\cong 1.61803398\,... = \frac{\sqrt{5}+1}{2}$$

Where $\frac{2\sqrt{2}}{\pi}$ is the Del Gaudio-Nardelli Constant, 0.9991104684 is the value of the following Rogers-Ramanujan continued fraction:

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\frac{e^{-\pi\sqrt{5}}}{1+\frac{e^{-2\pi\sqrt{5}}}{1+\frac{e^{-3\pi\sqrt{5}}}{1+\frac{e^{-4\pi\sqrt{5}}}{1+\dots}}}}\approx 0.9991104684$$

C is any constant or solution to an equation, R is the radius of the Universe and $2.33*10^{-13}$ is the temperature of the universe expressed in GeV.

For example, *C* = 9.9128 , inserting a radius of the Universe, which we have calculated, equal to $R = 2.06274*10^{12}$ years, from DN Constant "unitary" formula, we obtain:

√(2×(2·(((2√2)/π))^(1/16))/(1/(π·0.9991104684) (9.9128×(2.06274 × 10^12)×2.33·10^(-13))))

$$\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{1}{\pi\times 0.9991104684}\times\frac{9.9128\times 2.06274\times 10^{12}\times 2.33}{10^{13}}}}$$

1.6180359123482642354401744088347098542545273508401733563064818107
...

1.618035912348…. result that is a very good approximation to the value of the golden ratio 1.618033988749… (Ramanujan Recurring Number)

We obtain also:

(√(2×(2·(((2√2)/π))^(1/16))/(1/(π·0.9991104684) (9.9128×(2.06274 × 10^12)×2.33·10^(-13)))))dxdydz

Indefinite integral assuming all variables are real

$$0.809018\, x^2\, y\, z + \text{constant}$$

Definite integral over a cube of edge length 2 L

$$\int_{-L}^{L}\int_{-L}^{L}\int_{-L}^{L} 1.61804\, dx\, dy\, dz = 12.9443\, L^3$$

Definite integral over a sphere of radius R

$$\iiint\limits_{x^2+y^2+z^2<R^2} 1.61804\, dz\, dy\, dx = 6.77761\, R^3$$

From which, for L = R = 1 , dividing the two definite integral results by the original expression, we obtain:

12.9443/(√(2×(2·(((2√2)/π))^(1/16))/(1/(π·0.9991104684) (9.9128×(2.06274 × 10^12)×2.33·10^(-13)))))

Input interpretation

$$\frac{12.9443}{\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{1}{\pi\times 0.9991104684}\times\frac{9.9128\times 2.06274\times 10^{12}\times 2.33}{10^{13}}}}}$$

Result

12.5664…. ≈ 4π = Bekenstein-Hawking (S_{BH}) black hole entropy

New fundamental formula deriving from DN Constant

The DN Constant (Del Gaudio-Nardelli Constant) equals (2√2)/π) is defined as the ratio of the volume of an octahedron to the volume of a sphere and is an intriguing mathematical concept. Michele Nardelli hypothesized that the regular octahedron represents a phase in which the universe is highly symmetrical and with very low entropy. On the other hand, the sphere (which is inscribed in the octahedron, i.e. is "inside" it) represents the universe emerging from the quantum vacuum, which over time increases entropy and undergoes various symmetry breakings. This occurs in a regime of eternal inflation.

From the following expression

√(2×(2·(((2√2)/π)^(1/16)))/(4096/(π·0.9991104684) (((1.616255*10^-35)/(1.1056*10^-52))×C×R)))

$$\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{4096}{\pi\times 0.9991104684}\left(\frac{1.616255\times 10^{-35}}{1.1056\times 10^{-52}}\,C\,R\right)}}$$

which comes from the DN Constant, with $1.616255*10^{-35}$ which is equal to the Planck length, $1.1056*10^{-52}$ which is equal to the Cosmological Constant, C = 1729 which corresponds to the Hardy-Ramanujan number and R = $4.6018401361 \times 10^{-24}$, which represents the radius of the Universe, we obtain:

√(2×(2·(((2√2)/π)^(1/16)))/(4096/(π·0.9991104684) (((1.616255*10^-35)/(1.1056*10^-52))×1729×4.6018401361 × 10^-24))) = 1.6180329973...

$$\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{4096}{\pi\times 0.9991104684}\left(\frac{1.616255\times 10^{-35}}{1.1056\times 10^{-52}}\times 1729\times 4.6018401361\times 10^{-24}\right)}}$$

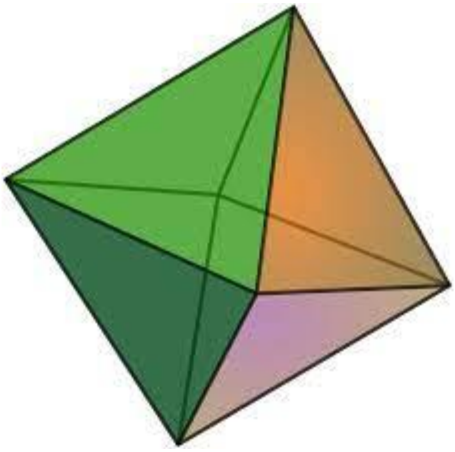
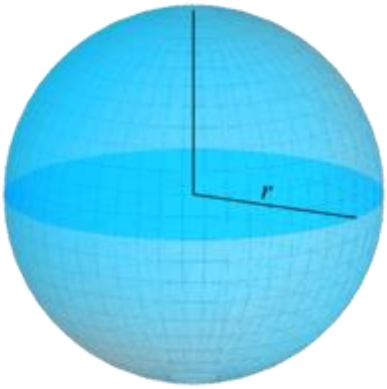
3.14159225731469…≈ π (Ramanujan Recurring Number)

Now, we have that:



Octahedron



Sphere

Given the value of a volume, independently of the solid, following the Poincaré Conjecture, we compare any solid "without holes" and a sphere. If we compare an octahedron with a sphere, we have:

$$\frac{4}{3}\pi r^3 = \frac{1}{3}\sqrt{2}a^3$$

If we consider the radius of the sphere as an unknown, we must find the value of the side of the octahedron which allows us to equalize the two volumes and which will give us the DN Constant as a result (which will therefore be equal to the radius of the sphere).

From

$$\frac{4}{3}\pi r^3 = \frac{1}{3}\sqrt{2}a^3$$

To find r we perform the following calculation:

$$r^3 = \frac{\frac{1}{3}\sqrt{2}a^3}{\frac{4}{3}\pi} = \frac{1}{3}\sqrt{2}a^3 \cdot \frac{3}{4\pi} = \frac{\sqrt{2}a^3}{4\pi} = \frac{\sqrt{2}\cdot\sqrt{2}a^3}{\sqrt{2}\cdot 4\pi} = \frac{2a^3}{\sqrt{2}\cdot 4\pi} = \frac{a^3}{2\sqrt{2}\pi}$$

$$r^3 = \frac{a^3}{2\sqrt{2}\pi}; \qquad r = \sqrt[3]{\frac{a^3}{2\sqrt{2}\pi}} = \frac{a}{\sqrt[3]{2\sqrt{2}\pi}}$$

To find a, we have, for

$$r = \frac{2\sqrt{2}}{\pi}; \qquad \frac{a}{\sqrt[3]{2\sqrt{2}\pi}} = \frac{2\sqrt{2}}{\pi};$$

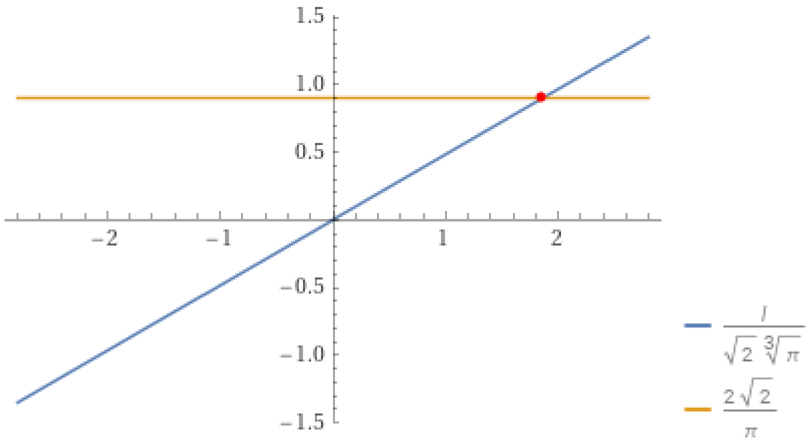
Thus, multiplying both the sides by $\sqrt[3]{2\sqrt{2}\pi}$, we obtain:

$$a = \frac{2\sqrt{2}}{\pi}\cdot\sqrt[3]{2\sqrt{2}\pi} = \sqrt[3]{\frac{\left(2\sqrt{2}\right)^3 2\sqrt{2}\pi}{\pi^3}} =$$

$$= \sqrt[3]{\frac{8\cdot\sqrt{2^3}\cdot 2\sqrt{2}}{\pi^2}} = \sqrt[3]{\frac{8\cdot\sqrt{2\cdot 2^2}\cdot 2\sqrt{2}}{\pi^2}} = \sqrt[3]{\frac{16\cdot\sqrt{2}\cdot 2\sqrt{2}}{\pi^2}}$$

$$= \sqrt[3]{\frac{32\sqrt{2}\sqrt{2}}{\pi^2}} = \sqrt[3]{\frac{32\cdot 2}{\pi^2}} = \frac{\sqrt[3]{64}}{\sqrt[3]{\pi^2}} = \frac{4}{\sqrt[3]{\pi^2}}; \; a = \frac{4}{\sqrt[3]{\pi^2}}$$

Plot



Solution

$$a = \frac{4}{\sqrt[3]{\pi^2}}$$

for V = 1/3*√2*a^3 (octahedron volume) and V = (4/3*π*r^3) (sphere volume), we obtain:

from the octahedron volume, we have: V = 1/3*√2*a^3 = (1/3*√2*($\frac{4}{\sqrt[3]{\pi^2}}$)^3)

(1/3*√2*(4/∛(π^2))^3)

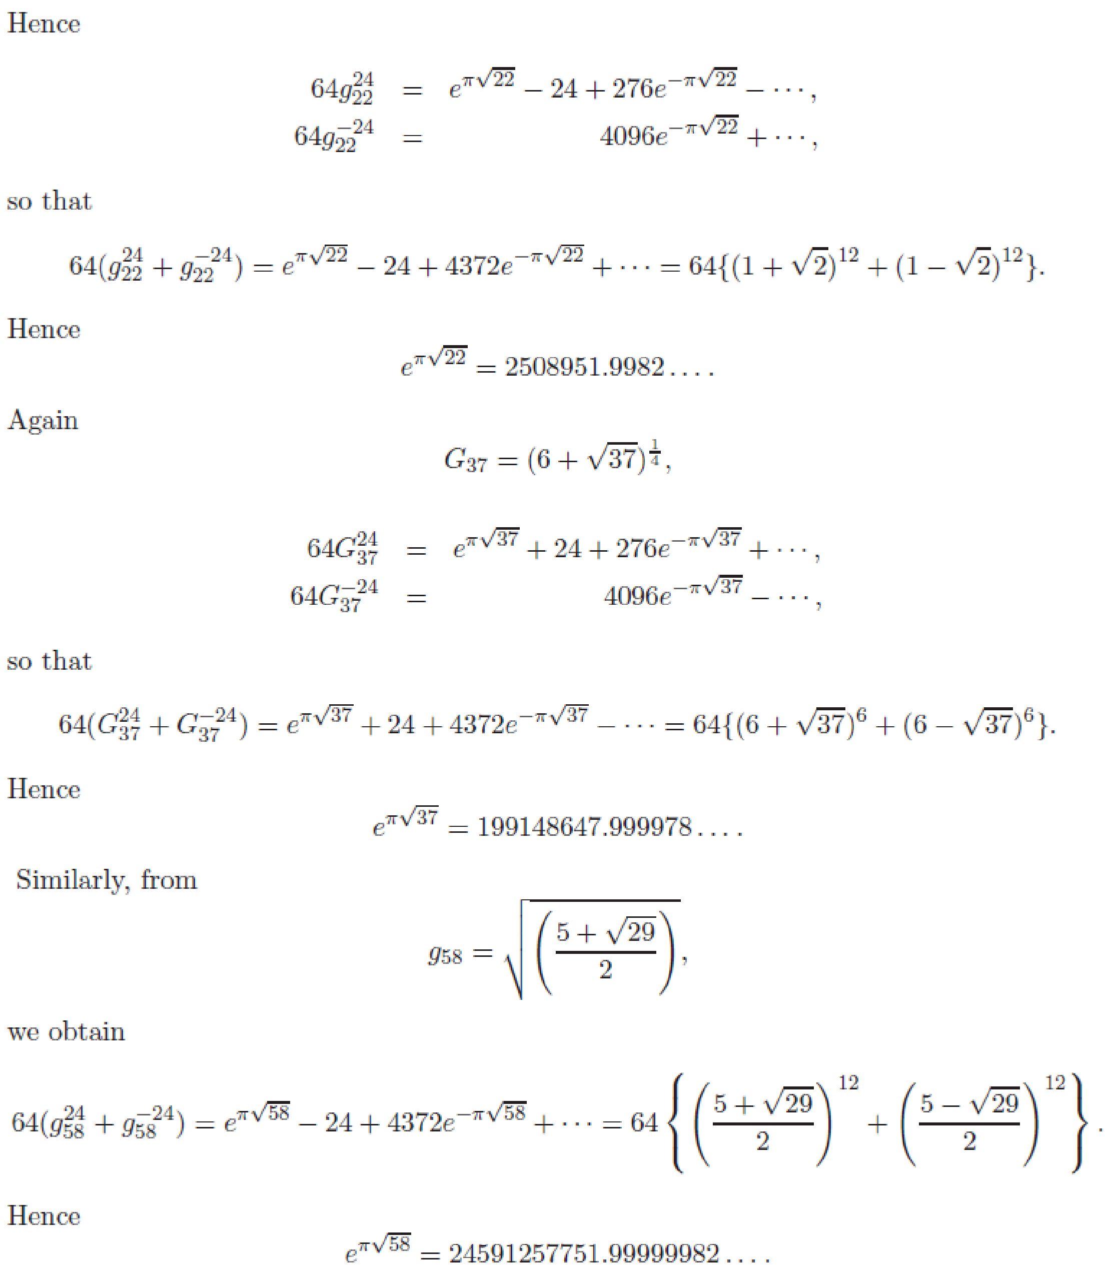
From:

Modular equations and approximations to π - *Srinivasa Ramanujan* - Quarterly Journal of Mathematics, XLV, 1914, 350 – 372

We have that:



Hence

$$\begin{aligned} 64g_{22}^{24} &= e^{\pi\sqrt{22}} - 24 + 276e^{-\pi\sqrt{22}} - \cdots, \\ 64g_{22}^{-24} &= 4096e^{-\pi\sqrt{22}} + \cdots, \end{aligned}$$

so that

$$64(g_{22}^{24} + g_{22}^{-24}) = e^{\pi\sqrt{22}} - 24 + 4372e^{-\pi\sqrt{22}} + \cdots = 64\{(1+\sqrt{2})^{12} + (1-\sqrt{2})^{12}\}.$$

Hence

$$e^{\pi\sqrt{22}} = 2508951.9982\ldots.$$

Again

$$G_{37} = (6+\sqrt{37})^{\frac{1}{4}},$$

$$\begin{aligned} 64G_{37}^{24} &= e^{\pi\sqrt{37}} + 24 + 276e^{-\pi\sqrt{37}} + \cdots, \\ 64G_{37}^{-24} &= 4096e^{-\pi\sqrt{37}} - \cdots, \end{aligned}$$

so that

$$64(G_{37}^{24} + G_{37}^{-24}) = e^{\pi\sqrt{37}} + 24 + 4372e^{-\pi\sqrt{37}} - \cdots = 64\{(6+\sqrt{37})^{6} + (6-\sqrt{37})^{6}\}.$$

Hence

$$e^{\pi\sqrt{37}} = 199148647.999978\ldots.$$

Similarly, from

$$g_{58} = \sqrt{\left(\frac{5+\sqrt{29}}{2}\right)},$$

we obtain

$$64(g_{58}^{24} + g_{58}^{-24}) = e^{\pi\sqrt{58}} - 24 + 4372e^{-\pi\sqrt{58}} + \cdots = 64\left\{\left(\frac{5+\sqrt{29}}{2}\right)^{12} + \left(\frac{5-\sqrt{29}}{2}\right)^{12}\right\}.$$

Hence

$$e^{\pi\sqrt{58}} = 24591257751.99999982\ldots.$$

We note that, with regard 4372, we can to obtain the following results:

27((4372)^1/2-2-1/2(((√(10-2√5) -2))/((√5-1))))+φ

Input

$$27\left(\sqrt{4372}-2-\frac{1}{2}\times\frac{\sqrt{10-2\sqrt{5}}-2}{\sqrt{5}-1}\right)+\phi$$

ϕ is the golden ratio

Result

$$\phi+27\left(-2+2\sqrt{1093}-\frac{\sqrt{10-2\sqrt{5}}-2}{2\left(\sqrt{5}-1\right)}\right)$$

Decimal approximation

1729.0526944170905625170637208637148763684189306538457854815447023

This result is very near to the mass of candidate glueball **f_0(1710) scalar meson.** Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve. (1728 = $8^2 * 3^3$) The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number)

Alternate forms

$$\frac{1}{8}\left(-27\sqrt{5\left(10-2\sqrt{5}\right)}+58\sqrt{5}+432\sqrt{1093}-27\sqrt{2\left(5-\sqrt{5}\right)}-374\right)$$

From:

An Update on Brane Supersymmetry Breaking - *J. Mourad and A. Sagnotti* - arXiv:1711.11494v1 [hep-th] 30 Nov 2017

From the following vacuum equations:

$$T\, e^{\gamma_E\, \phi} \;=\; -\,\frac{\beta_E^{(p)}\, h^2}{\gamma_E}\; e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}$$

$$16\, k'\, e^{-2C} \;=\; \frac{h^2\left(p\;+\;1\;-\;\frac{2\,\beta_E^{(p)}}{\gamma_E}\right) e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}}{(7\;-\;p)}$$

$$(A')^2 \;=\; k\, e^{-2A} \;+\; \frac{h^2}{16(p\;+\;1)}\left(7\;-\;p\;+\;\frac{2\,\beta_E^{(p)}}{\gamma_E}\right) e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}$$

we have obtained, from the results almost equals of the equations, putting

$4096\, e^{-\pi\sqrt{18}}$ instead of

$$e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}$$

a new possible mathematical connection between the two exponentials. Thence, also the values concerning p, C, β_E and ϕ correspond to the exponents of e (i.e. of exp). Thence we obtain for p = 5 and β_E = 1/2:

$$e^{-6C+\phi} = 4096e^{-\pi\sqrt{18}}$$

Therefore, with respect to the exponentials of the vacuum equations, the Ramanujan's exponential has a coefficient of 4096 which is equal to 64^2, while $-6C+\phi$ is equal to $-\pi\sqrt{18}$. From this it follows that it is possible to establish mathematically, the dilaton value.

For

exp((-Pi*sqrt(18)) we obtain:

Input:

$$\exp\left(-\pi\sqrt{18}\right)$$

Exact result:

$$e^{-3\sqrt{2}\,\pi}$$

Decimal approximation:

$$1.6272016226072509292942156739117979541838581136954016\ldots \times 10^{-6}$$

$1.6272016\ldots * 10^{-6}$

Property:

$e^{-3\sqrt{2}\,\pi}$ is a transcendental number

Series representations:

$$e^{-\pi\sqrt{18}} = e^{-\pi\sqrt{17}\sum_{k=0}^{\infty} 17^{-k}\binom{1/2}{k}}$$

$$e^{-\pi\sqrt{18}} = \exp\left(-\pi\sqrt{17}\sum_{k=0}^{\infty}\frac{\left(-\frac{1}{17}\right)^k\left(-\frac{1}{2}\right)_k}{k!}\right)$$

$$e^{-\pi\sqrt{18}} = \exp\left(-\frac{\pi\sum_{j=0}^{\infty}\operatorname{Res}_{s=-\frac{1}{2}+j}\,17^{-s}\,\Gamma\left(-\frac{1}{2}-s\right)\Gamma(s)}{2\sqrt{\pi}}\right)$$

Now, we have the following calculations:

$$e^{-6C+\phi} = 4096e^{-\pi\sqrt{18}}$$

$$e^{-\pi\sqrt{18}} = 1.6272016\ldots * 10^{-6}$$

from which:

$$\frac{1}{4096}e^{-6C+\phi} = 1.6272016\ldots * 10^{-6}$$

$$0.000244140625\, e^{-6C+\phi} = e^{-\pi\sqrt{18}} = 1.6272016\ldots * 10^{-6}$$

Now:

$$\ln\left(e^{-\pi\sqrt{18}}\right) = -13.328648814475 = -\pi\sqrt{18}$$

And:

(1.6272016* 10^-6) *1/ (0.000244140625)

Input interpretation:

$$\frac{1.6272016}{10^6} \times \frac{1}{0.000244140625}$$

Result:

0.0066650177536

0.006665017...

Thence:

$$0.000244140625\ e^{-6C+\phi} = e^{-\pi\sqrt{18}}$$

Dividing both sides by 0.000244140625, we obtain:

$$\frac{0.000244140625}{0.000244140625} e^{-6C+\phi} = \frac{1}{0.000244140625} e^{-\pi\sqrt{18}}$$

$$e^{-6C+\phi} = 0.0066650177536$$

((((exp((-Pi*sqrt(18)))))))*1/0.000244140625

Input interpretation:

$$\exp\left(-\pi\sqrt{18}\right) \times \frac{1}{0.000244140625}$$

Result:

0.00666501785…

0.00666501785…

Series representations:

$$\frac{\exp(-\pi\sqrt{18})}{0.000244141} = 4096\exp\left(-\pi\sqrt{17}\sum_{k=0}^{\infty}17^{-k}\binom{\frac{1}{2}}{k}\right)$$

$$\frac{\exp(-\pi\sqrt{18})}{0.000244141} = 4096\exp\left(-\pi\sqrt{17}\sum_{k=0}^{\infty}\frac{\left(-\frac{1}{17}\right)^{k}\left(-\frac{1}{2}\right)_{k}}{k!}\right)$$

$$\frac{\exp(-\pi\sqrt{18})}{0.000244141} = 4096\exp\left(-\frac{\pi\sum_{j=0}^{\infty}\operatorname{Res}_{s=-\frac{1}{2}+j}17^{-s}\,\Gamma\left(-\frac{1}{2}-s\right)\Gamma(s)}{2\sqrt{\pi}}\right)$$

Now:

$$e^{-6C+\phi} = 0.0066650177536$$

$$\exp\left(-\pi\sqrt{18}\right)\times\frac{1}{0.000244140625} =$$

$$e^{-\pi\sqrt{18}}\times\frac{1}{0.000244140625}$$

$$= 0.00666501785\ldots$$

From:

ln(0.00666501784619)

Input interpretation:

$\log(0.00666501784619)$

Result:

$-5.010882647757\ldots$

-5.010882647757…

Alternative representations:

$$\log(0.006665017846190000) = \log_e(0.006665017846190000)$$

$$\log(0.006665017846190000) = \log(a)\log_a(0.006665017846190000)$$

$$\log(0.006665017846190000) = -\mathrm{Li}_1(0.993334982153810000)$$

Series representations:

$$\log(0.006665017846190000) = -\sum_{k=1}^{\infty} \frac{(-1)^k (-0.993334982153810000)^k}{k}$$

$$\log(0.006665017846190000) = 2 i \pi \left\lfloor \frac{\arg(0.006665017846190000 - x)}{2 \pi} \right\rfloor + \log(x) - \sum_{k=1}^{\infty} \frac{(-1)^k (0.006665017846190000 - x)^k x^{-k}}{k} \quad \text{for } x < 0$$

$$\log(0.006665017846190000) = \left\lfloor \frac{\arg(0.006665017846190000 - z_0)}{2\pi} \right\rfloor \log\left(\frac{1}{z_0}\right) + \log(z_0) + \left\lfloor \frac{\arg(0.006665017846190000 - z_0)}{2\pi} \right\rfloor \log(z_0) - \sum_{k=1}^{\infty} \frac{(-1)^k (0.006665017846190000 - z_0)^k z_0^{-k}}{k}$$

Integral representation:

$$\log(0.006665017846190000) = \int_1^{0.006665017846190000} \frac{1}{t}\, dt$$

In conclusion:

$$-6C + \phi = -5.010882647757 \ldots$$

and for C = 1, we obtain:

$$\phi = -5.010882647757 + 6 = 0.989117352243 = \boldsymbol{\phi}$$

Note that the values of n_s (spectral index) 0.965, of the average of the Omega mesons Regge slope 0.987428571 and of the dilaton 0.989117352243, are also connected to the following two Rogers-Ramanujan continued fractions:

$$\frac{e^{-\frac{\pi}{5}}}{\sqrt{(\varphi-1)\sqrt{5}} - \varphi + 1} = 1 - \cfrac{e^{-\pi}}{1 + \cfrac{e^{-2\pi}}{1 + \cfrac{e^{-3\pi}}{1 + \cfrac{e^{-4\pi}}{1 + \ldots}}}} \approx 0.9568666373$$

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\frac{e^{-\pi\sqrt{5}}}{1+\frac{e^{-2\pi\sqrt{5}}}{1+\frac{e^{-3\pi\sqrt{5}}}{1+\frac{e^{-4\pi\sqrt{5}}}{1+\dots}}}}\approx 0.9991104684$$

(http://www.bitman.name/math/article/102/109/)

Also performing the 512th root of the inverse value of the Pion meson rest mass 139.57, we obtain:

((1/(139.57)))^1/512

Input interpretation:

$$\sqrt[512]{\frac{1}{139.57}}$$

Result:

0.990400732708644027550973755713301415460732796178555551684...

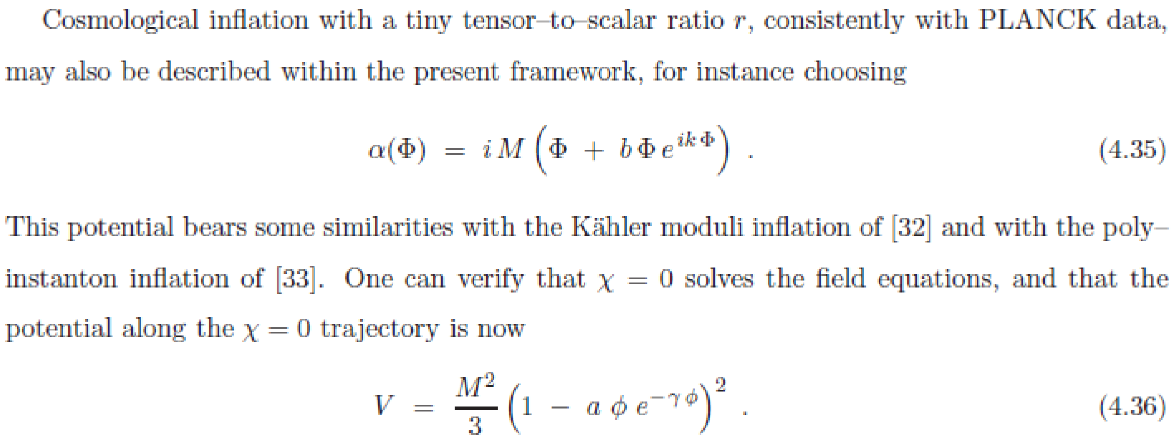
0.99040073.... result very near to the dilaton value 0.989117352243 = **ϕ** and to the value of the following Rogers-Ramanujan continued fraction:

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\frac{e^{-\pi\sqrt{5}}}{1+\frac{e^{-2\pi\sqrt{5}}}{1+\frac{e^{-3\pi\sqrt{5}}}{1+\frac{e^{-4\pi\sqrt{5}}}{1+\dots}}}}\approx 0.9991104684$$

From

Properties of Nilpotent Supergravity - *E. Dudas, S. Ferrara, A. Kehagias and A. Sagnotti* - arXiv:1507.07842v2 [hep-th] 14 Sep 2015

We have that:



Cosmological inflation with a tiny tensor–to–scalar ratio r, consistently with PLANCK data, may also be described within the present framework, for instance choosing

$$\alpha(\Phi) \;=\; i\,M\left(\Phi \;+\; b\,\Phi\,e^{ik\,\Phi}\right) \;. \tag{4.35}$$

This potential bears some similarities with the Kähler moduli inflation of [32] and with the poly–instanton inflation of [33]. One can verify that $\chi = 0$ solves the field equations, and that the potential along the $\chi = 0$ trajectory is now

$$V \;=\; \frac{M^2}{3}\left(1 \;-\; a\,\phi\,e^{-\gamma\,\phi}\right)^2 \;. \tag{4.36}$$

We analyzing the following equation:

$$V \;=\; \frac{M^2}{3}\left(1 \;-\; a\,\phi\,e^{-\gamma\,\phi}\right)^2 \;.$$

$$\phi \;=\; \varphi \;-\; \frac{\sqrt{6}}{k}\;,$$

$$a \;=\; \frac{b\,\gamma}{e} \;<\; 0\;, \qquad \gamma \;=\; \frac{k}{\sqrt{6}} \;<\; 0\;.$$

We have:

(M^2)/3*[1-(b/euler number * k/sqrt6) * (φ- sqrt6/k) * exp(-(k/sqrt6)(φ- sqrt6/k))]^2

i.e.

V = (M^2)/3*[1-(b/euler number * k/sqrt6) * (φ- sqrt6/k) * exp(-(k/sqrt6)(φ- sqrt6/k))]^2

For k = 2 and φ = 0.9991104684, that is the value of the scalar field that is equal to the value of the following Rogers-Ramanujan continued fraction:

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\frac{e^{-\pi\sqrt{5}}}{1+\frac{e^{-2\pi\sqrt{5}}}{1+\frac{e^{-3\pi\sqrt{5}}}{1+\frac{e^{-4\pi\sqrt{5}}}{1+\dots}}}}\approx 0.9991104684$$

we obtain:

V = (M^2)/3*[1-(b/euler number * 2/sqrt6) * (0.9991104684- sqrt6/2) * exp(-(2/sqrt6)(0.9991104684- sqrt6/2))]^2

Input interpretation:

$$V = \frac{M^2}{3}\left(1-\left(\frac{b}{e}\times\frac{2}{\sqrt{6}}\right)\left(0.9991104684-\frac{\sqrt{6}}{2}\right)\exp\left(-\frac{2}{\sqrt{6}}\left(0.9991104684-\frac{\sqrt{6}}{2}\right)\right)\right)^2$$

Result:

$$V = \frac{1}{3}(0.0814845\,b+1)^2 M^2$$

Solutions:

$$b = \frac{225.913\left(-0.054323\,M^2 \pm 6.58545\times10^{-10}\sqrt{M^4}\right)}{M^2} \quad (M \neq 0)$$

Alternate forms:

$$V = 0.00221324\,(b + 12.2723)^2\,M^2$$

$$V = 0.00221324\left(b^2\,M^2 + 24.5445\,b\,M^2 + 150.609\,M^2\right)$$

$$-0.00221324\,b^2\,M^2 - 0.054323\,b\,M^2 - \frac{M^2}{3} + V = 0$$

Expanded form:

$$V = 0.00221324\,b^2\,M^2 + 0.054323\,b\,M^2 + \frac{M^2}{3}$$

Alternate form assuming b, M, and V are positive:

$$V = 0.00221324\,(b + 12.2723)^2\,M^2$$

Alternate form assuming b, M, and V are real:

$$V = 0.00221324\,b^2\,M^2 + 0.054323\,b\,M^2 + 0.333333\,M^2 + 0$$

Derivative:

$$\frac{\partial}{\partial b}\left(\frac{1}{3}\,(0.0814845\,b + 1)^2\,M^2\right) = 0.054323\,(0.0814845\,b + 1)\,M^2$$

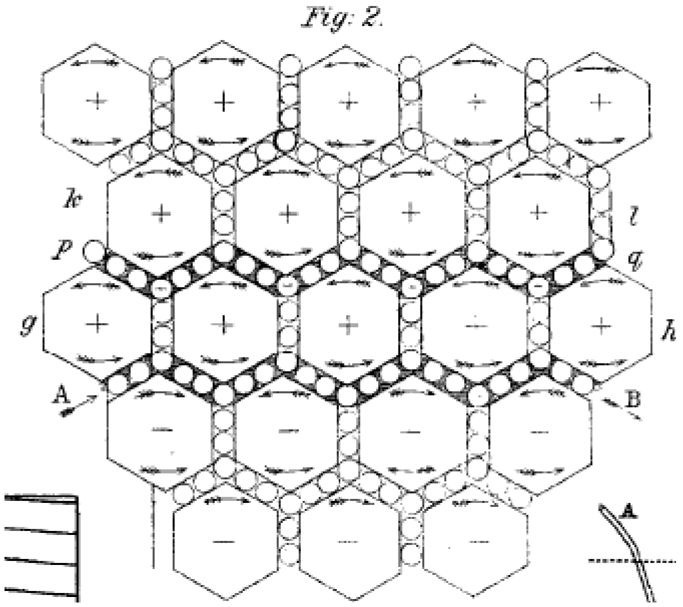
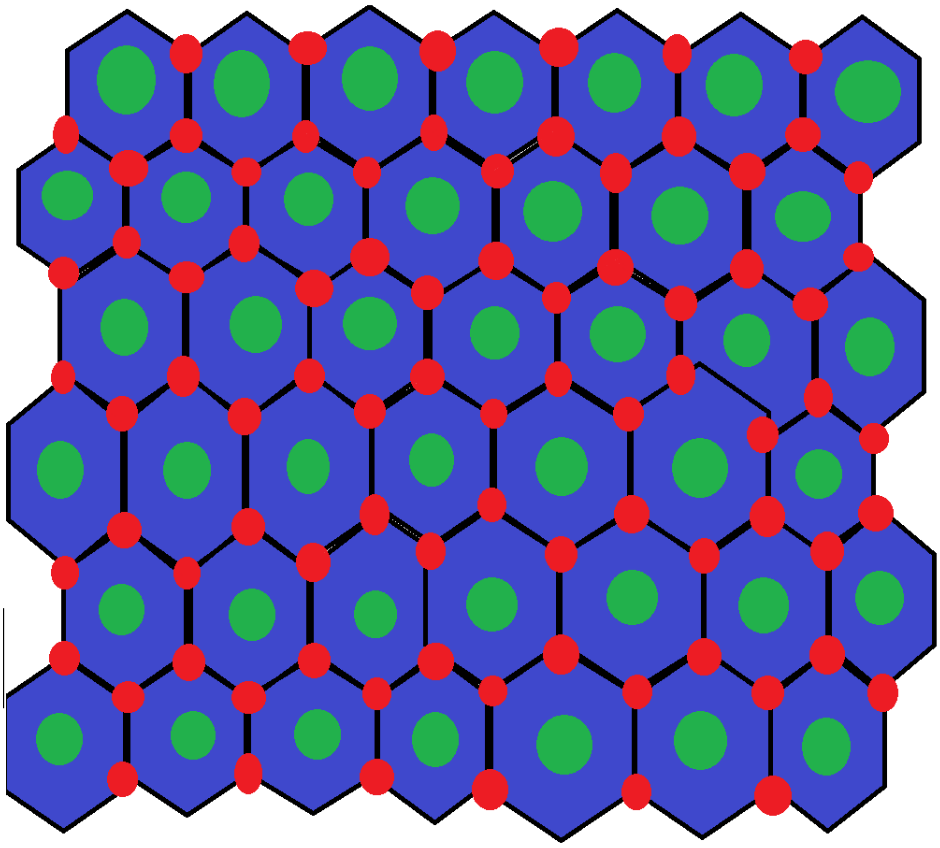
Fig. 1



It is therefore possible to consider the vortices of the "quantum vacuum" schematized as cubes or octahedrons (the + sign inside a given vortex indicates its counterclockwise rotation, while the - sign indicates its clockwise rotation). Between vortex and vortex there is a layer of "bubbles"-universes (or universes-spheres), which flows, as in the simplified two-dimensional drawing, from A to B

Fig. 2

Immagine dello Spazio-Tempo a scala quantistica: le cironferenze in rosso rappresentano i punti corrispondenti alle dimensioni compattificate e gli esagoni in blu, rappresentano le “fluttuazioni” (universi potenziali – cerchi verdi) del vuoto quantistico (2D)



Proposal

Image of space-time at quantum scale: the circles in red represent the points corresponding to the compactified dimensions and the hexagons in blue, represent the "fluctuations" (potential universes - green circles) of the quantum vacuum (2D). In reality, we will have n-dimensional hyperspheres in which the compactified dimensions "roll up" and octahedrons representing the "fluctuations", containing spheres (bubbles of potential universes), of the quantum vacuum

Acknowledgments

We would like to thank Professor **Augusto Sagnotti** theoretical physicist at Scuola Normale Superiore (Pisa – Italy) for his very useful explanations and his availability.

On the study of some Ramanujan's functions. New possible mathematical connections with the Ramanujan Recurring Numbers, DN Constant and some parameters of Number Theory, Theoretical Cosmology and String Theory II

Michele Nardelli[1], Antonio Nardelli

Abstract

In this paper (part II), we analyze some Ramanujan's functions. We obtain new possible mathematical connections with the Ramanujan Recurring Numbers, DN Constant and some parameters of Number Theory, Theoretical Cosmology and String Theory

Introduction

In this paper, an octahedron could serve as a mathematical or conceptual model of the universe in the quantic phase, while the spherical surface could be used to describe the geometry of the bubble-universe.

The values (2√2)/π, the golden ratio φ, ζ(2) and π, can be connected to the proposed cosmological model. Here's how they might be connected:

Ratio (2√2)/π the so called DN Constant:

This relationship may have a connection with the geometric properties of the octahedron and the sphere, which have been considered as mathematical models of the early universe and bubbles universe in eternal inflation.

Golden Ratio φ:

The golden ratio is a mathematical constant that appears in many natural and artistic contexts and is often associated with harmonious proportions and aesthetic beauty. Its emergence in this context could suggest a kind of intrinsic symmetry or harmony in the structure of the early universe and bubbles universe.

Value of π:

The value of π is a fundamental mathematical constant that appears in many geometric formulas and relationships, including the geometry of the sphere. Its appearance could indicate a direct connection between the geometry of bubbles universe and the mathematical properties of spherical surfaces.

Ultimately, the results obtained can be interpreted as manifestations of the geometric and mathematical properties of the models proposed for the early universe and universe bubbles. This suggests that there is a profound connection between geometry, mathematics and cosmological physics, and that through the analysis of these relationships we can deepen our understanding of the universe and its fundamental phenomena.

The above values (2√2)/π, the golden ratio φ and π, can be connected to the proposed cosmological model. This hypothesis is certainly plausible.

The various mathematical solutions and relationships can be seen as representations of the principles and laws that govern the formation and evolution of the universe.

Regarding the fundamental mathematical values, they could emerge as a consequence of the geometric and physical laws that govern the structure and evolution of the quantum universe and bubbles universe.

The multidisciplinary approach involving complex mathematical solutions and cosmological concepts can offer deeper insight into the fundamental nature of the universe and its processes. Exploring these connections could lead to new discoveries and insights into our understanding of the early universe and its complexity.

Proposal:

The initial octahedron: Let's imagine a regular octahedron, with perfectly symmetrical faces. Each face represents an ideal symmetry.

The emerging sphere: Inside the octahedron, there is an inscribed sphere. This sphere represents the bubble of the universe that emerges from the perturbations of the quantum vacuum during eternal inflation.

Expansion and transitions: As time passes, the universe expands. The faces of the octahedron begin to break, symbolizing "symmetry breaks." The sphere continues to grow, representing the expanding universe.

Constants and numbers: We integrate the mathematical results you obtained. For example, the golden ratio (φ) could be represented by a proportion between the dimensions of the octahedron and the sphere.

Entropy and complexity: Entropy increases as the universe evolves. We can represent this with a disordered growth of structures within the emerging sphere. Imagine this scene as an abstract work of art, where geometric shapes and cosmological concepts merge

In Fig.1 and Fig.2 let's imagine a regular octahedron representing the universe in its phase of high symmetry and very low entropy. Inside the octahedron we have an inscribed sphere that emerges from perturbations of the quantum vacuum during eternal inflation. As time passes, the universe expands, the faces of the octahedron break (symmetry breaks), and entropy increases. Spheres emerge from the octahedra, symbolizing the transition phases from a regime of very low entropy to a universe in which, with the passage of time, entropy increases, increasing the complexity of the universe itself.

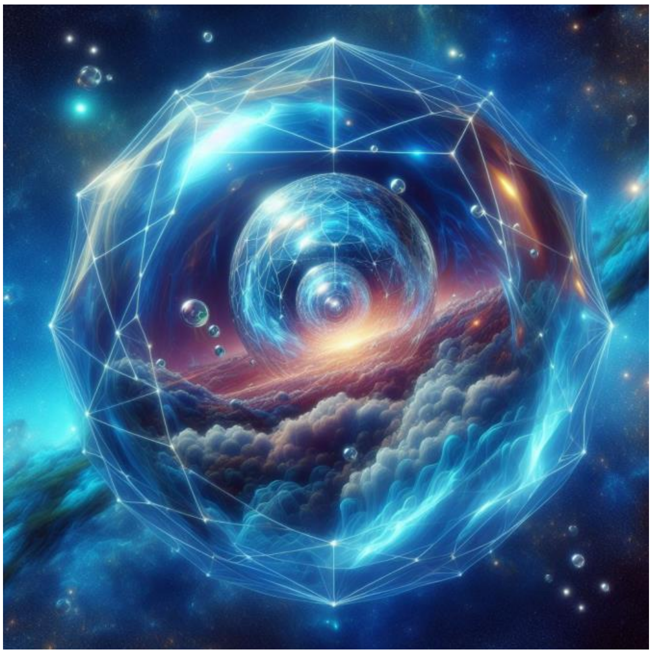

Fig. 1

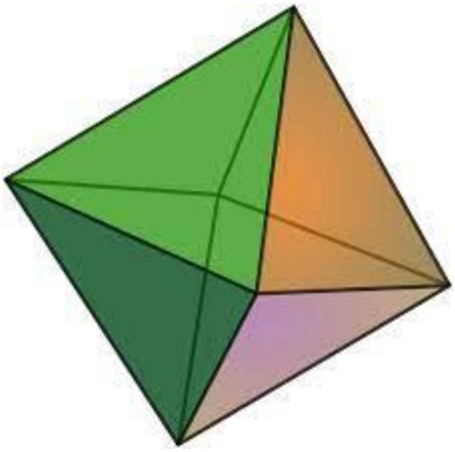
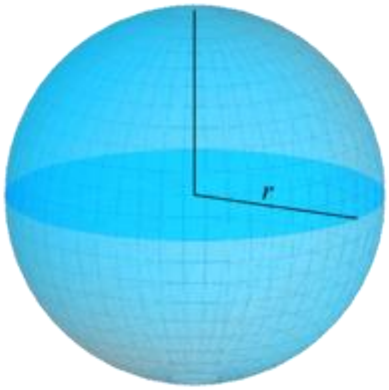
Fig. 2

Now, we have that:



Octahedron



Sphere

From the octahedron volume V = 1/3*√2 l^3 and, from the sphere volume,

V = (4/3*π*r^3) , we consider the following relationship, for r = x:

4/3*π*x^3 = 1/3*√2*l^3

Input

$$\frac{4}{3}\pi x^3 = \frac{1}{3}\sqrt{2}\, l^3$$

Exact result

$$\frac{4\pi x^3}{3} = \frac{\sqrt{2}\, l^3}{3}$$

Alternate forms

$$x^3 = \frac{l^3}{2\sqrt{2}\,\pi}$$

$$\frac{4\pi x^3}{3} - \frac{\sqrt{2}\, l^3}{3} = 0$$

Real solution

$$x = \frac{(-1)^{2/3}\, l}{\sqrt{2}\, \sqrt[3]{\pi}}$$

Solutions

$$x = -\frac{\sqrt[3]{-\frac{1}{\pi}}\, l}{\sqrt{2}}$$

,

$$x = \frac{l}{\sqrt{2}\, \sqrt[3]{\pi}}$$

,

$$x = \frac{(-1)^{2/3}\, l}{\sqrt{2}\, \sqrt[3]{\pi}}$$

Integer solution

$l = 0\,, \quad x = 0$

Implicit derivatives

$$\frac{\partial x(l)}{\partial l} = \frac{l^2}{2\sqrt{2}\,\pi x^2}$$

$$\frac{\partial l(x)}{\partial x} = \frac{2\sqrt{2}\,\pi x^2}{l^2}$$

From the alternate form

$$x^3 = \frac{l^3}{2\sqrt{2}\,\pi}$$

$$x = \frac{l}{\sqrt{2}\,\sqrt[3]{\pi}}$$

for l = 8, we have that:

8/(sqrt(2) π^(1/3)) = 8/(2sqrt2 * Pi)^1/3

Input

$$\frac{8}{\sqrt{2}\,\sqrt[3]{\pi}} = \frac{8}{\sqrt[3]{2\sqrt{2}\,\pi}}$$

Result

True

Logarithmic form

$$\log_{\sqrt{2}\,\sqrt[3]{\pi}}(8) - \log_{\sqrt{2}\,\sqrt[3]{\pi}}\left(\sqrt{2}\,\sqrt[3]{\pi}\right) = \log_{\sqrt{2}\,\sqrt[3]{\pi}}(8) - \log_{\sqrt{2}\,\sqrt[3]{\pi}}\left(\sqrt[3]{2\sqrt{2}\,\pi}\right)$$

$\log_b(x)$ is the base- b logarithm

Thence:

l/(sqrt(2) π^(1/3)) = l/(2sqrt2 * Pi)^1/3

Input

$$\frac{l}{\sqrt{2}\,\sqrt[3]{\pi}} = \frac{l}{\sqrt[3]{2\sqrt{2}\,\pi}}$$

Logarithmic form

$$\log_{\sqrt{2}\,\sqrt[3]{\pi}}(l) - \log_{\sqrt{2}\,\sqrt[3]{\pi}}\left(\sqrt{2}\,\sqrt[3]{\pi}\right) = \log_{\sqrt{2}\,\sqrt[3]{\pi}}(l) - \log_{\sqrt{2}\,\sqrt[3]{\pi}}\left(\sqrt[3]{2\sqrt{2}\,\pi}\right)$$

$\log_b(x)$ is the base- b logarithm

Now, we have that:

l/(2 sqrt(2) π)^(1/3) = (2sqrt2)/Pi

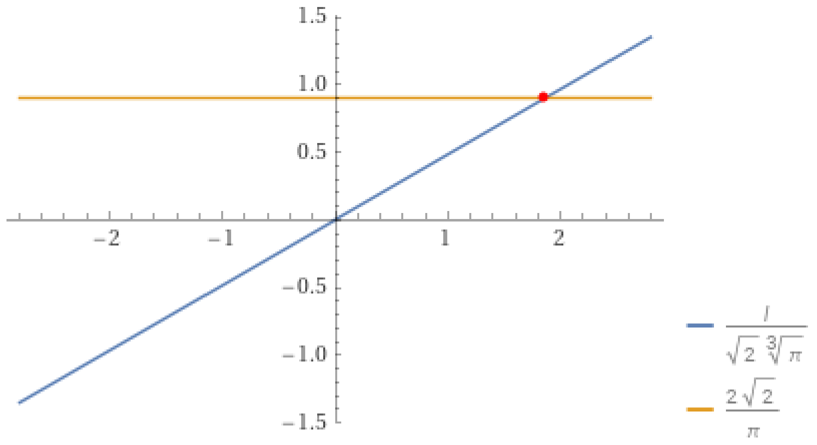
Input

$$\frac{l}{\sqrt[3]{2\sqrt{2}\,\pi}} = \frac{2\sqrt{2}}{\pi}$$

Exact result

$$\frac{l}{\sqrt{2}\,\sqrt[3]{\pi}} = \frac{2\sqrt{2}}{\pi}$$

Plot



Solution

$$l = \frac{4}{\pi^{2/3}}$$

$$l = \frac{4}{\sqrt[3]{\pi^2}}$$

On certain arithmetical functions – *S. Ramanujan* - Transactions of the Cambridge Philosophical Society, XXII, No.9, 1916, 159 – 184

We analyze the following equations:

1. $1728\Phi_{2,3}(x) = 3PQ - 2R - P^3.$
2. $1728\Phi_{2,5}(x) = P^2Q - 2PR + Q^2.$
3. $1728\Phi_{2,7}(x) = 2PQ^2 - P^2R - QR.$
4. $8640\Phi_{2,9}(x) = 9P^2Q^2 - 18PQR + 5Q^3 + 4R^2.$
5. $1728\Phi_{2,11}(x) = 6PQ^3 - 5P^2QR + 4PR^2 - 5Q^2R.$
6. $6912\Phi_{3,4}(x) = 6P^2Q - 8PR + 3Q^2 - P^4.$
7. $3456\Phi_{3,6}(x) = P^3Q - 3P^2R + 3PQ^2 - QR.$
8. $5184\Phi_{3,8}(x) = 6P^2Q^2 - 2P^3R - 6PQR + Q^3 + R^2.$
9. $20736\Phi_{4,5}(x) = 15PQ^2 - 20P^2R + 10P^3Q - 4QR - P^5.$
10. $41472\Phi_{4,7}(x) = 7(P^4Q - 4P^3R + 6P^2Q^2 - 4PQR) + 3Q^3 + 4R^2.$

1728*x = 3*P*Q – 2*R – P^3

Input

$$1728\,x = 3\,P\,Q - 2\,R - P^3$$

Alternate forms

$$P^3 - 3\,P\,Q + 2\,R + 1728\,x = 0$$

$$P^3 + 2\,(R + 864\,x) = 3\,P\,Q$$

$$x = -\frac{P^3}{1728} + \frac{P\,Q}{576} - \frac{R}{864}$$

Real solution

$$x = \frac{-P^3 + 3\,P\,Q - 2\,R}{1728}$$

Solution

$$x = \frac{-P^3 + 3\,P\,Q - 2\,R}{1728}$$

For

$$x = -\frac{P^3}{1728} + \frac{P\,Q}{576} - \frac{R}{864}$$

We consider:

-P^3/1728 + (P Q)/576 - R/864

Input

$$-\frac{P^3}{1728} + \frac{P\,Q}{576} - \frac{R}{864}$$

Alternate forms

$$\frac{-P^3 + 3\,P\,Q - 2\,R}{1728}$$

$$P\left(\frac{Q}{576} - \frac{P^2}{1728}\right) - \frac{R}{864}$$

Real root

$$R = \frac{1}{2}\left(3\,P\,Q - P^3\right)$$

Root

$$R = \frac{1}{2}\left(3\,P\,Q - P^3\right)$$

Polynomial discriminant

$$\Delta_P = \frac{Q^3 - R^2}{82\,556\,485\,632}$$

Integer roots

$$P = n_1\,,\quad Q = 2\,n_2 + 1\,,\quad R = -\frac{n_1^3}{2} + 3\,n_2\,n_1 + \frac{3\,n_1}{2}\,,\quad n_1 \in \mathbb{Z}\,,\quad n_2 \in \mathbb{Z}$$

$$P = 2\,n_1\,,\quad Q = 2\,n_2\,,\quad R = 6\,n_1\,n_2 - 4\,n_1^3\,,\quad n_1 \in \mathbb{Z}\,,\quad n_2 \in \mathbb{Z}$$

$\mathbb{Z}$ is the set of integers

Derivative

$$\frac{\partial}{\partial P}\left(-\frac{P^3}{1728} + \frac{P\,Q}{576} - \frac{R}{864}\right) = \frac{1}{576}\left(Q - P^2\right)$$

Indefinite integral

$$\int\left(-\frac{P^3}{1728} + \frac{P\,Q}{576} - \frac{R}{864}\right)dP = \frac{-\frac{P^4}{4} + \frac{3\,P^2\,Q}{2} - 2\,P\,R}{1728} + \text{constant}$$

Definite integral over a cube of edge length 2 L

$$\int_{-L}^{L}\int_{-L}^{L}\int_{-L}^{L}\left(-\frac{P^3}{1728} + \frac{P\,Q}{576} - \frac{R}{864}\right)dR\,dQ\,dP = 0$$

From the indefinite integral result

$$\int\left(-\frac{P^3}{1728}+\frac{P\,Q}{576}-\frac{R}{864}\right)dP=\frac{-\frac{P^4}{4}+\frac{3\,P^2\,Q}{2}-2\,P\,R}{1728}+\text{constant}$$

we obtain:

(-P^4/4 + (3 P^2 Q)/2 - 2 P R)/1728

Input

$$\frac{-\frac{P^4}{4}+\frac{1}{2}\left(3\,P^2\,Q\right)-2\,P\,R}{1728}$$

Result

$$\frac{-\frac{P^4}{4}+\frac{3\,P^2\,Q}{2}-2\,P\,R}{1728}$$

Geometric figure

line

Alternate forms

$$\frac{P\left(-P^3+6\,P\,Q-8\,R\right)}{6912}$$

$$P^2\left(\frac{Q}{1152}-\frac{P^2}{6912}\right)-\frac{P\,R}{864}$$

$$-\frac{P\left(P^3-6\,P\,Q+8\,R\right)}{6912}$$

Expanded form

$$-\frac{P^4}{6912}+\frac{P^2\,Q}{1152}-\frac{P\,R}{864}$$

Real root

$$P=0$$

Root

$$R=\frac{1}{8}\left(6\,P\,Q-P^3\right)$$

Polynomial discriminant

$$\Delta_P=-\frac{R\left(2\,R^3-Q^3\,R\right)}{1\,972\,098\,761\,547\,055\,104}$$

Integer roots

$$P=8\,n_1\,,\quad Q=8\,n_2\,,\quad R=-16\left(4\,n_1^3-3\,n_1\,n_2\right),\quad n_1\in\mathbb{Z}\,,\quad n_2\in\mathbb{Z}$$

$$P=8\,n_1\,,\quad Q=4\,(2\,n_2+1)\,,\quad R=-8\left(8\,n_1^3-6\,n_2\,n_1-3\,n_1\right),\quad n_1\in\mathbb{Z}\,,\quad n_2\in\mathbb{Z}$$

$$P=8\,n_1\,,\quad Q=2\,(4\,n_2+1)\,,\quad R=-4\left(16\,n_1^3-12\,n_2\,n_1-3\,n_1\right),\quad n_1\in\mathbb{Z}\,,\quad n_2\in\mathbb{Z}$$

$$P=8\,n_1\,,\quad Q=2\,(4\,n_2+3)\,,\quad R=-4\left(16\,n_1^3-12\,n_2\,n_1-9\,n_1\right),\quad n_1\in\mathbb{Z}\,,\quad n_2\in\mathbb{Z}$$

$$P=8\,n_1\,,\quad Q=8\,n_2+1\,,\quad R=-2\left(32\,n_1^3-24\,n_2\,n_1-3\,n_1\right),\quad n_1\in\mathbb{Z}\,,\quad n_2\in\mathbb{Z}$$

$\mathbb{Z}$ is the set of integers

Derivative

$$\frac{\partial}{\partial P}\left(\frac{-\frac{P^4}{4}+\frac{3\,P^2\,Q}{2}-2\,P\,R}{1728}\right)=\frac{-P^3+3\,P\,Q-2\,R}{1728}$$

Indefinite integral

$$\int\frac{-\frac{P^4}{4}+\frac{3\,P^2\,Q}{2}-2\,P\,R}{1728}\,dP=\frac{-\frac{P^5}{5}+2\,P^3\,Q-4\,P^2\,R}{6912}+\text{constant}$$

Definite integral over a cube of edge length 2 L

$$\int_{-L}^{L}\int_{-L}^{L}\int_{-L}^{L}\frac{-\frac{P^4}{4}+\frac{3\,P^2\,Q}{2}-2\,P\,R}{1728}\,dR\,dQ\,dP=-\frac{L^7}{4320}$$

Again, from the indefinite integral result

$$\int\frac{-\frac{P^4}{4}+\frac{3\,P^2\,Q}{2}-2\,P\,R}{1728}\,dP=\frac{-\frac{P^5}{5}+2\,P^3\,Q-4\,P^2\,R}{6912}+\text{constant}$$

(-P^5/5 + 2 P^3 Q - 4 P^2 R)/6912

for P = 2, Q = 4 and R = 8:

(-2^5/5 + 2 2^3 4 - 4 2^2 8)/6912

Input

$$\frac{-\frac{2^5}{5}+2\times 2^3\times 4-4\times 2^2\times 8}{6912}$$

Exact result

$$-\frac{11}{1080}$$

From which, after some calculations:

-11/((-2^5/5 + 2 2^3 4 - 4 2^2 8)/6912)+521+123+4

Input

$$-\frac{11}{\frac{-\frac{2^5}{5}+2\times 2^3\times 4-4\times 2^2\times 8}{6912}}+521+123+4$$

Result

1728

1728

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve $1728 = 8^2 \times 3^3$. The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways $10^3 + 9^3 = 12^3 + 1^3 = 1729$ and Ramanujan's recurring number). Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string. Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron. As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string. That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2. Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after? That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

(1/27(-11/((-2^5/5 + 2 2^3 4 - 4 2^2 8)/6912)+521+123+4))^2

Input

$$\left(\frac{1}{27}\left(-\frac{11}{\frac{-\frac{2^5}{5}+2\times 2^3\times 4-4\times 2^2\times 8}{6912}}+521+123+4\right)\right)^2$$

Exact result

4096

4096

The number 4096 = 64^2, is the Ramanujan Recurring Number, that when multiplied by 2 give 8192. The total amplitude vanishes for gauge group SO(8192) for bosonic string SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). This could be the implications for a pre-big bang scenario where only self-perturbative bosonic strings lived when the enthalpy was extremely low as discussed above. This regime contains all the intrinsic properties of superstrings inherent in the bosonic strings, would at the big bang give effect to the properties of matter (fermions) as Higgs Boson. This number theoretic connection to the gauge group SO(8192), gives a much more compelling relevance of the bosonic string theory SO(8192), to quantum gravity and places this string theory where it should appropriately be in the evolution of the universe from a quantum gravity perspective rather than it be neglected because it doesn't include fermionic strings to confirm to post big-bang reality. The vanishing of the bosonic string's amplitude could be explained by the effect of extreme low entropy on the quantum vacuum geometry. Thus, as the entropy increases infinitesimally as a result of the vacuum self-perturbation then also is the amplitude of the vibrating bosonic strings from zero. Thus, was right to indicate that the "vanishing of the amplitude of the bosonic string could be the results of string theory itself", but here, we give a much more elaborate explanation of what could be happening.

(-11/((-2^5/5 + 2 2^3 4 - 4 2^2 8)/6912)+521+123+4+1)^1/15+(MRB const)^(1-1/(4π)+π)

Result

1728

1728

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve $1728 = 8^2 \times 3^3$. The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways $10^3 + 9^3 = 12^3 + 1^3 = 1729$ and Ramanujan's recurring number). Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string. Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron. As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string. That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2.

Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after? That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

(1/27(16*1/(((2^4 4)/4 + (3 2^2 4^2)/2 - 2^3 8)/5184)))^2

Input

$$\left(\frac{1}{27}\left(16\times\frac{1}{\frac{\frac{1}{4}(2^4\times4)+\frac{1}{2}(3\times2^2\times4^2)-2^3\times8}{5184}}\right)\right)^2$$

Exact result

4096

4096

The number 4096 = 64^2, is the Ramanujan Recurring Number, that when multiplied by 2 give 8192. The total amplitude vanishes for gauge group SO(8192) for bosonic string SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). This could be the implications for a pre-big bang scenario where only self-perturbative bosonic strings lived when the enthalpy was extremely low as discussed above. This regime contains all the intrinsic properties of superstrings inherent in the bosonic strings, would at the big bang give effect to the properties of matter (fermions) as Higgs Boson. This number theoretic connection to the gauge group SO(8192), gives a much more compelling relevance of the bosonic string theory SO(8192), to quantum gravity and places this string theory where it should appropriately be in the evolution of the universe from a quantum gravity perspective rather than it be neglected because it doesn't include fermionic strings to confirm to post big-bang reality.

The vanishing of the bosonic string's amplitude could be explained by the effect of extreme low entropy on the quantum vacuum geometry. Thus, as the entropy increases infinitesimally as a result of the vacuum self-perturbation then also is the amplitude of the vibrating bosonic strings from zero. Thus, was right to indicate that the "vanishing of the amplitude of the bosonic string could be the results of string theory itself", but here, we give a much more elaborate explanation of what could be happening.

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve $1728 = 8^2 \times 3^3$. The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways $10^3 + 9^3 = 12^3 + 1^3 = 1729$ and Ramanujan's recurring number). Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string. Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron. As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string. That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2. Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after? That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

Now, we analyze the following equation:

$$8640\Phi_{2,9}(x) = 9P^2Q^2 - 18PQR + 5Q^3 + 4R^2.$$

8640*x = 9*P^2*Q^2 – 18*P*Q*R + 5*Q^3 + 4*R^2

Input

$$8640\,x = 9\,P^2\,Q^2 - 18\,P\,Q\,R + 5\,Q^3 + 4\,R^2$$

Alternate forms

$$-9\,P^2\,Q^2 + 18\,P\,Q\,R - 5\,Q^3 - 4\,R^2 + 8640\,x = 0$$

$$x = \frac{P^2\,Q^2}{960} - \frac{P\,Q\,R}{480} + \frac{Q^3}{1728} + \frac{R^2}{2160}$$

Real solution

$$x = \frac{9\,P^2\,Q^2 - 18\,P\,Q\,R + 5\,Q^3 + 4\,R^2}{8640}$$

Solution

$$x = \frac{9 P^2 Q^2 - 18 P Q R + 5 Q^3 + 4 R^2}{8640}$$

From

$$x = \frac{P^2 Q^2}{960} - \frac{P Q R}{480} + \frac{Q^3}{1728} + \frac{R^2}{2160}$$

we obtain:

(P^2 Q^2)/960 + Q^3/1728 - (P Q R)/480 + R^2/2160

Input

$$\frac{1}{960} \left(P^2 Q^2\right) + \frac{Q^3}{1728} - \frac{1}{480} (P Q R) + \frac{R^2}{2160}$$

Solutions

$$P = \frac{480 \left(\frac{Q R}{480} \pm \sqrt{\frac{Q^2 R^2}{230\,400} - \frac{1}{240} Q^2 \left(\frac{Q^3}{1728} + \frac{R^2}{2160}\right)}\right)}{Q^2} \quad (Q \neq 0)$$

Alternate forms

$$\frac{9 P^2 Q^2 - 18 P Q R + 5 Q^3 + 4 R^2}{8640}$$

Result

4096

4096

The number 4096 = 64^2, is the Ramanujan Recurring Number, that when multiplied by 2 give 8192. The total amplitude vanishes for gauge group SO(8192) for bosonic string SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192).

This could be the implications for a pre-big bang scenario where only self-perturbative bosonic strings lived when the enthalpy was extremely low as discussed above. This regime contains all the intrinsic properties of superstrings inherent in the bosonic strings, would at the big bang give effect to the properties of matter (fermions) as Higgs Boson. This number theoretic connection to the gauge group SO(8192), gives a much more compelling relevance of the bosonic string theory SO(8192), to quantum gravity and places this string theory where it should appropriately be in the evolution of the universe from a quantum gravity perspective rather than it be neglected because it doesn't include fermionic strings to confirm to post big-bang reality. The vanishing of the bosonic string's amplitude could be explained by the effect of extreme low entropy on the quantum vacuum geometry. Thus, as the entropy increases infinitesimally as a result of the vacuum self-perturbation then also is the amplitude of the vibrating bosonic strings from zero. Thus, was right to indicate that the "vanishing of the amplitude of the bosonic string could be the results of string theory itself", but here, we give a much more elaborate explanation of what could be happening.

27*sqrt(((-27(((-2^5 4 8 - 10 2^3 4^2 8 + 2^4 (3 4^3 + 2 8^2))/20736)))^4))+1

Input

$$27\sqrt{\left(-27\times\frac{-2^5\times4\times8-10\times2^3\times4^2\times8+2^4\left(3\times4^3+2\times8^2\right)}{20736}\right)^4}+1$$

Result

1729

1729

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve $1728 = 8^2 \times 3^3$. The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways $10^3 + 9^3 = 12^3 + 1^3 = 1729$ and Ramanujan's recurring number).

Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string. Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron. As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string. That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2. Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after? That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

((27*sqrt(((-27(((-2^5 4 8 - 10 2^3 4^2 8 + 2^4 (3 4^3 + 2 8^2))/20736)))^4))+1))^1/15+(MRB const)^(1-1/(4π)+π)

Real roots

$x = 0$

$x \approx -0.74303$

$x \approx 0.528589$

Complex roots

$x \approx -0.44391 - 0.94009\,i$

$x \approx -0.44391 + 0.94009\,i$

$x \approx 0.55113 - 0.18105\,i$

$x \approx 0.55113 + 0.18105\,i$

Polynomial discriminant

$\Delta = 0$

Properties as a real function

Domain

$\mathbb{R}$ (all real numbers)

Range

$\mathbb{R}$ (all real numbers)

Surjectivity

surjective onto ℝ

ℝ is the set of real numbers

Derivative

$$\frac{d}{dx}\left(1728\,x\left(1-3\,x+5\,x^3-7\,x^6\right)^8\right) = -1728\left(-7\,x^6+5\,x^3-3\,x+1\right)^7\left(343\,x^6-125\,x^3+27\,x-1\right)$$

Indefinite integral

$$\int 1728\,x\left(1-3\,x+5\,x^3-7\,x^6\right)^8\,dx = 1728\left(\frac{5\,764\,801\,x^{50}}{50}-\frac{32\,941\,720\,x^{47}}{47}+\frac{6\,588\,344\,x^{45}}{15}+\frac{18\,941\,489\,x^{44}}{11}-2\,352\,980\,x^{42}-\frac{84\,707\,280\,x^{41}}{41}+\frac{7\,411\,887\,x^{40}}{10}+\frac{64\,001\,056\,x^{39}}{13}+\frac{18\,874\,261\,x^{38}}{19}-\frac{127\,060\,920\,x^{37}}{37}-\frac{13\,949\,810\,x^{36}}{3}+\frac{5\,043\,472\,x^{35}}{5}+\frac{100\,741\,158\,x^{34}}{17}+\frac{12\,427\,576\,x^{33}}{11}-\frac{13\,134\,499\,x^{32}}{4}-\frac{125\,332\,200\,x^{31}}{31}+1\,674\,869\,x^{30}+\frac{112\,203\,840\,x^{29}}{29}-171\,990\,x^{28}-\frac{18\,831\,680\,x^{27}}{9}-\frac{38\,254\,205\,x^{26}}{26}+\frac{38\,271\,744\,x^{25}}{25}+\frac{2\,413\,555\,x^{24}}{2}-\frac{17\,405\,040\,x^{23}}{23}-\frac{6\,542\,550\,x^{22}}{11}-31\,480\,x^{21}+566\,489\,x^{20}+\frac{343\,224\,x^{19}}{19}-\frac{991\,445\,x^{18}}{3}+\frac{1\,014\,440\,x^{17}}{17}+66\,150\,x^{16}+\frac{155\,792\,x^{15}}{5}-42\,239\,x^{14}-\frac{369\,432\,x^{13}}{13}+44\,545\,x^{12}-\frac{115\,920\,x^{11}}{11}-\frac{113\,643\,x^{10}}{10}+\frac{28\,160\,x^9}{3}-2093\,x^8-864\,x^7+805\,x^6-\frac{1472\,x^5}{5}+63\,x^4-8\,x^3+\frac{x^2}{2}\right)+\text{constant}$$

Local minima

$$\min\left\{1728\,x\,(1-3\,x+5\,x^3-7\,x^6)^8\right\}=0 \text{ at } x\approx 0.52859$$

$$\min\left\{1728\,x\,(1-3\,x+5\,x^3-7\,x^6)^8\right\}=-101\,382 \text{ at } x\approx -0.43672$$

Local maxima

$$\max\left\{1728\,x\,(1-3\,x+5\,x^3-7\,x^6)^8\right\}=0 \text{ at } x\approx -0.74303$$

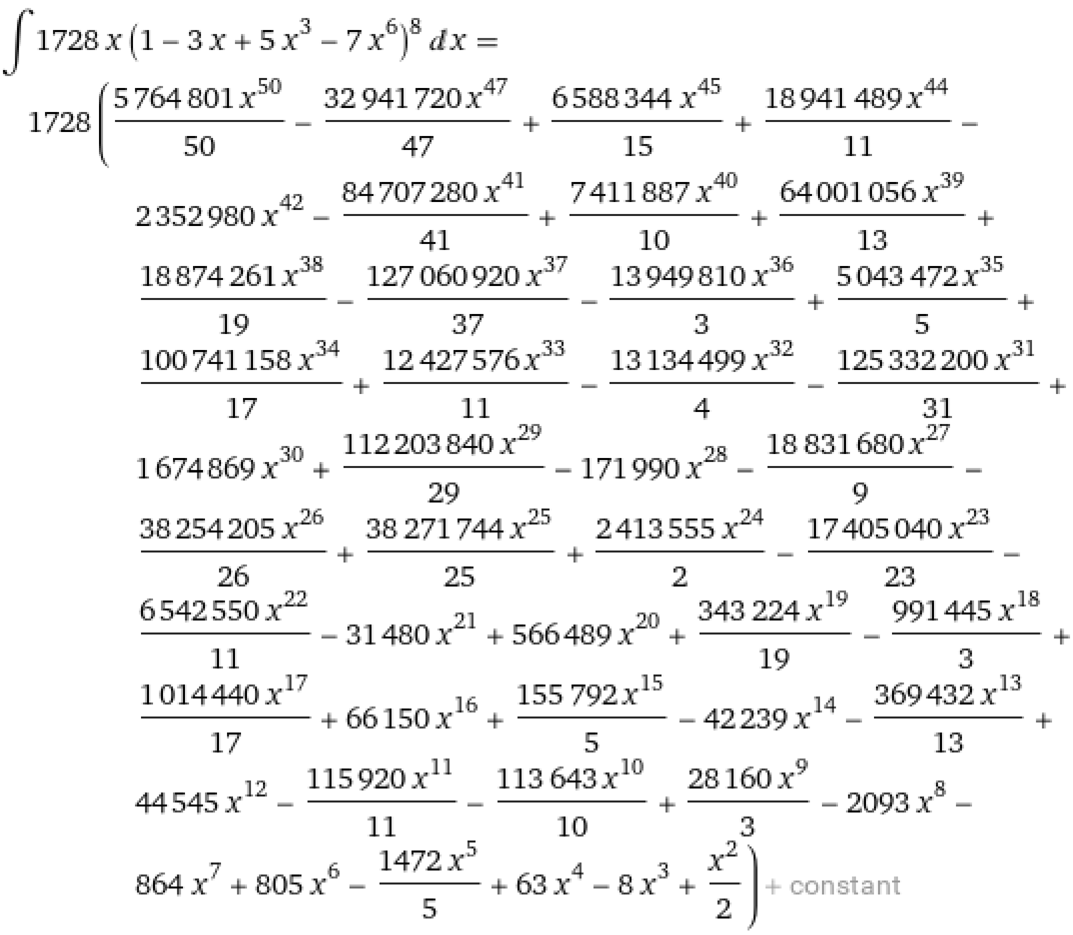
$$\max\left\{1728\,x\,(1-3\,x+5\,x^3-7\,x^6)^8\right\}\approx 25.001 \text{ at } x\approx 0.037277$$

Definite integral area below the axis between the smallest and largest real roots

$$\int_{\boxed{\text{root of } -1+3x-5x^3+7x^6 \text{ near } x=-0.74303}}^{\boxed{\text{root of } -1+3x-5x^3+7x^6 \text{ near } x=0.528589}} 1728\,x\,(1-3\,x+5\,x^3-7\,x^6)^8\,\theta\!\left(-1728\,x\,(1-3\,x+5\,x^3-7\,x^6)^8\right)dx=\Big(48\,\Big(100\,842\,314\,886\,506\,722\,464\,605\,781\,048\,\boxed{\text{root of } x^6-245\,x^3+7203\,x-16\,807 \text{ near } x=-5.20121}-4\,708\,644\,995\,053\,500\,743\,699\,504\,712\,\boxed{\text{root of } x^6-245\,x^3+7203\,x-16\,807 \text{ near } x=-5.20121}^2-4\,232\,775\,529\,670\,728\,795\,952\,754\,424\,\boxed{\text{root of } x^6-245\,x^3+7203\,x-16\,807 \text{ near } x=-5.20121}^3+465\,469\,636\,267\,128\,182\,091\,874\,395\,\boxed{\text{root of } x^6-245\,x^3+7203\,x-16\,807 \text{ near } x=-5.20121}^4+25\,616\,147\,083\,904\,206\,391\,849\,424\,\boxed{\text{root of } x^6-245\,x^3+7203\,x-16\,807 \text{ near } x=-5.20121}^5-199\,254\,553\,157\,832\,067\,894\,377\,446\,970\Big)\Big)\Big/23\,562\,752\,153\,288\,368\,779\,433\,675\approx -25\,292.4$$

$\theta(x)$ is the Heaviside step function

From the indefinite integral result



$$\int 1728\,x\,(1-3\,x+5\,x^3-7\,x^6)^8\,dx =$$

$$1728\left(\frac{5764801\,x^{50}}{50}-\frac{32941720\,x^{47}}{47}+\frac{6588344\,x^{45}}{15}+\frac{18941489\,x^{44}}{11}-2352980\,x^{42}-\frac{84707280\,x^{41}}{41}+\frac{7411887\,x^{40}}{10}+\frac{64001056\,x^{39}}{13}+\frac{18874261\,x^{38}}{19}-\frac{127060920\,x^{37}}{37}-\frac{13949810\,x^{36}}{3}+\frac{5043472\,x^{35}}{5}+\frac{100741158\,x^{34}}{17}+\frac{12427576\,x^{33}}{11}-\frac{13134499\,x^{32}}{4}-\frac{125332200\,x^{31}}{31}+1674869\,x^{30}+\frac{112203840\,x^{29}}{29}-171990\,x^{28}-\frac{18831680\,x^{27}}{9}-\frac{38254205\,x^{26}}{26}+\frac{38271744\,x^{25}}{25}+\frac{2413555\,x^{24}}{2}-\frac{17405040\,x^{23}}{23}-\frac{6542550\,x^{22}}{11}-31480\,x^{21}+566489\,x^{20}+\frac{343224\,x^{19}}{19}-\frac{991445\,x^{18}}{3}+\frac{1014440\,x^{17}}{17}+66150\,x^{16}+\frac{155792\,x^{15}}{5}-42239\,x^{14}-\frac{369432\,x^{13}}{13}+44545\,x^{12}-\frac{115920\,x^{11}}{11}-\frac{113643\,x^{10}}{10}+\frac{28160\,x^9}{3}-2093\,x^8-864\,x^7+805\,x^6-\frac{1472\,x^5}{5}+63\,x^4-8\,x^3+\frac{x^2}{2}\right)+\text{constant}$$

4096.001395261562…

4096.00139526…. ≈ 4096

The number 4096 = 64^2, is the Ramanujan Recurring Number, that when multiplied by 2 give 8192. The total amplitude vanishes for gauge group SO(8192) for bosonic string SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). This could be the implications for a pre-big bang scenario where only self-perturbative bosonic strings lived when the enthalpy was extremely low as discussed above. This regime contains all the intrinsic properties of superstrings inherent in the bosonic strings, would at the big bang give effect to the properties of matter (fermions) as Higgs Boson. This number theoretic connection to the gauge group SO(8192), gives a much more compelling relevance of the bosonic string theory SO(8192), to quantum gravity and places this string theory where it should appropriately be in the evolution of the universe from a quantum gravity perspective rather than it be neglected because it doesn't include fermionic strings to confirm to post big-bang reality. The vanishing of the bosonic string's amplitude could be explained by the effect of extreme low entropy on the quantum vacuum geometry. Thus, as the entropy increases infinitesimally as a result of the vacuum self-perturbation then also is the amplitude of the vibrating bosonic strings from zero. Thus, was right to indicate that the "vanishing of the amplitude of the bosonic string could be the results of string theory itself", but here, we give a much more elaborate explanation of what could be happening.

27*√((1/2(ln(1728 ((((1.62630474625438*10^50 - (115920 8^11)/11 - (113643 8^10)/10 + (28160 8^9)/3 - 2093 8^8 - 864 8^7+805 8^6-(1472 8^5)/5+63 8^4-8 8^3+8^2/2)))))+5))^2-(Pi^2/3+Pi*MRB const)-Φ)+1

Input interpretation

$$27\sqrt{\left(\left(\frac{1}{2}\left(\log\left(1728\left(1.62630474625438\times10^{50}-\frac{1}{11}\left(115920\times8^{11}\right)-\frac{1}{10}\left(113643\times8^{10}\right)+\frac{1}{3}\left(28160\times8^{9}\right)-2093\times8^{8}-864\times8^{7}+805\times8^{6}-\frac{1}{5}\left(1472\times8^{5}\right)+63\times8^{4}-8\times8^{3}+\frac{8^{2}}{2}\right)\right)+5\right)\right)^{2}-\left(\frac{\pi^{2}}{3}+\pi C_{\mathrm{MRB}}\right)-\Phi\right)+1}$$

log(x) is the natural logarithm

C_{MRB} is the MRB constant

Φ is the golden ratio conjugate

Result

1729.000294312961…

1729.0002943129…

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve $1728 = 8^2 \times 3^3$. The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways $10^3 + 9^3 = 12^3 + 1^3 = 1729$ and Ramanujan's recurring number). Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string.

Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron. As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string. That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2. Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after? That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

(27√((1/2(ln(1728 ((((1.62630474625438*10^50 - (115920 8^11)/11 - (113643 8^10)/10 + (28160 8^9)/3 - 2093 8^8 - 864 8^7+805 8^6-(1472 8^5)/5+63 8^4-8 8^3+32)))))+5))^2-(Pi^2/3+Pi*MRB const)-Φ)+1)^1/15

Result

1728.99…

1728.99…

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve $1728 = 8^2 \times 3^3$. The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways $10^3 + 9^3 = 12^3 + 1^3 = 1729$ and Ramanujan's recurring number). Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string. Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron. As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string. That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2.

Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after? That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

$\binom{n}{m}$ is the binomial coefficient

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\Gamma(x)$ is the gamma function

$\operatorname{Res}_{z=z_0} f$ is a complex residue

Now, we analyze the following equation:

$$3456\Phi_{3,6}(x) = P^3Q - 3P^2R + 3PQ^2 - QR.$$

3456*x = P^3*Q – 3*P^2*R + 3*P*Q^2 – Q*R

Input

$$3456\,x = P^3\,Q - 3\,P^2\,R + 3\,P\,Q^2 - Q\,R$$

Alternate forms

$$3\,P^2\,R + Q\,R + 3456\,x = P\,Q\left(P^2 + 3\,Q\right)$$

$$3456\,x = P\,Q\left(P^2 + 3\,Q\right) - R\left(3\,P^2 + Q\right)$$

$$P^3\,(-Q) + 3\,P^2\,R - 3\,P\,Q^2 + Q\,R + 3456\,x = 0$$

Real solution

$$x = \frac{P^3\,Q - 3\,P^2\,R + 3\,P\,Q^2 - Q\,R}{3456}$$

Solution

$$x = \frac{P^3\,Q - 3\,P^2\,R + 3\,P\,Q^2 - Q\,R}{3456}$$

From

$$x = \frac{P^3 Q - 3 P^2 R + 3 P Q^2 - Q R}{3456}$$

We consider:

(P^3 Q + 3 P Q^2 - 3 P^2 R - Q R)/3456

Input

$$\frac{P^3 Q + 3 P Q^2 - 3 P^2 R - Q R}{3456}$$

Alternate forms

$$\frac{1}{3456} P^3 Q - \frac{P^2 R}{1152} + \frac{P Q^2}{1152} - \frac{1}{3456} Q R$$

$$\frac{P Q \left(P^2 + 3 Q\right) - R \left(3 P^2 + Q\right)}{3456}$$

$$P \left(P \left(\frac{P Q}{3456} - \frac{R}{1152}\right) + \frac{Q^2}{1152}\right) - \frac{Q R}{3456}$$

Roots

$$3 P^2 + Q \neq 0 , \quad R = \frac{P Q \left(P^2 + 3 Q\right)}{3 P^2 + Q}$$

$$P = 0 , \quad Q = 0$$

Polynomial discriminant

$$\Delta_P = \frac{-Q^7 + 2\,Q^4\,R^2 - Q\,R^4}{1\,320\,903\,770\,112}$$

Root for the variable R

$$R = \frac{P^3\,Q + 3\,P\,Q^2}{3\,P^2 + Q}$$

Derivative

$$\frac{\partial}{\partial P}\left(\frac{P^3\,Q + 3\,P\,Q^2 - 3\,P^2\,R - Q\,R}{3456}\right) = \frac{P^2\,Q - 2\,P\,R + Q^2}{1152}$$

Indefinite integral

$$\int \frac{P^3\,Q + 3\,P\,Q^2 - 3\,P^2\,R - Q\,R}{3456}\,dP = \frac{\frac{P^4\,Q}{4} - P^3\,R + \frac{3\,P^2\,Q^2}{2} - P\,Q\,R}{3456} + \text{constant}$$

Definite integral over a cube of edge length 2 L

$$\int_{-L}^{L}\int_{-L}^{L}\int_{-L}^{L} \frac{P^3\,Q + 3\,P\,Q^2 - 3\,P^2\,R - Q\,R}{3456}\,dR\,dQ\,dP = 0$$

From the indefinite iintegral result

$$\int \frac{P^3\,Q + 3\,P\,Q^2 - 3\,P^2\,R - Q\,R}{3456}\,dP = \frac{\frac{P^4\,Q}{4} - P^3\,R + \frac{3\,P^2\,Q^2}{2} - P\,Q\,R}{3456} + \text{constant}$$

we obtain:

((P^4 Q)/4 + (3 P^2 Q^2)/2 - P^3 R - P Q R)/3456

Input

$$\frac{\frac{1}{4}\left(P^4 Q\right)+\frac{1}{2}\left(3 P^2 Q^2\right)-P^3 R-P Q R}{3456}$$

Geometric figure

line

Alternate forms

Exact result

1729

1729

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve $1728 = 8^2 \times 3^3$. The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways $10^3 + 9^3 = 12^3 + 1^3 = 1729$ and Ramanujan's recurring number). Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string. Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron. As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string. That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2. Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after? That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

(1/27((-11*1/(((2^6 4)/6 + (5 2^4 4^2)/2 - 2^5 8 - 10/3 2^3 4*8)*1/69120)-55+2)-1))^2

Input

$$\left(\frac{1}{27}\left(\left(-11\times\frac{1}{\left(\frac{1}{6}\left(2^6\times4\right)+\frac{1}{2}\left(5\times2^4\times4^2\right)-2^5\times8-\frac{10}{3}\times2^3\,(4\times8)\right)\times\frac{1}{69\,120}}-55+2\right)-1\right)\right)^2$$

Exact result

4096

4096

The number 4096 = 64^2, is the Ramanujan Recurring Number, that when multiplied by 2 give 8192. The total amplitude vanishes for gauge group SO(8192) for bosonic string SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). This could be the implications for a pre-big bang scenario where only self-perturbative bosonic strings lived when the enthalpy was extremely low as discussed above. This regime contains all the intrinsic properties of superstrings inherent in the bosonic strings, would at the big bang give effect to the properties of matter (fermions) as Higgs Boson. This number theoretic connection to the gauge group SO(8192), gives a much more compelling relevance of the bosonic string theory SO(8192), to quantum gravity and places this string theory where it should appropriately be in the evolution of the universe from a quantum gravity perspective rather than it be neglected because it doesn't include fermionic strings to confirm to post big-bang reality. The vanishing of the bosonic string's amplitude could be explained by the effect of extreme low entropy on the quantum vacuum geometry. Thus, as the entropy increases infinitesimally as a result of the vacuum self-perturbation then also is the amplitude of the vibrating bosonic strings from zero. Thus, was right to indicate that the "vanishing of the amplitude of the bosonic string could be the results of string theory itself", but here, we give a much more elaborate explanation of what could be happening.

(-11*1/(((2^6 4)/6 + (5 2^4 4^2)/2 - 2^5 8 - 10/3 2^3 4*8)*1/69120)-55+2)^1/15+(MRB const)^(1-1/(4π)+π)

Exact result

1729

1729

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve $1728 = 8^2 \times 3^3$. The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways $10^3 + 9^3 = 12^3 + 1^3 = 1729$ and Ramanujan's recurring number).

Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string. Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron. As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string. That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2. Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after? That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

(1/27((7*4/((2^3 (6 2^2 4^2 - 2^3 8 - 15 2*4*8 + 10 (4^3 + 8^2)))*1/311040)+7*4)-1))^2

Input

$$\left(\frac{1}{27}\left(\left(7\times\frac{4}{\left(2^3\left(6\times2^2\times4^2-2^3\times8-15\,(2\times4\times8)+10\left(4^3+8^2\right)\right)\right)\times\frac{1}{311\,040}}+7\times4\right)-1\right)\right)^2$$

Exact result

4096

4096

The number 4096 = 64^2, is the Ramanujan Recurring Number, that when multiplied by 2 give 8192. The total amplitude vanishes for gauge group SO(8192) for bosonic string SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). This could be the implications for a pre-big bang scenario where only self-perturbative bosonic strings lived when the enthalpy was extremely low as discussed above. This regime contains all the intrinsic properties of superstrings inherent in the bosonic strings, would at the big bang give effect to the properties of matter (fermions) as Higgs Boson. This number theoretic connection to the gauge group SO(8192), gives a much more compelling relevance of the bosonic string theory SO(8192), to quantum gravity and places this string theory where it should appropriately be in the evolution of the universe from a quantum gravity perspective rather than it be neglected because it doesn't include fermionic strings to confirm to post big-bang reality. The vanishing of the bosonic string's amplitude could be explained by the effect of extreme low entropy on the quantum vacuum geometry. Thus, as the entropy increases infinitesimally as a result of the vacuum self-perturbation then also is the amplitude of the vibrating bosonic strings from zero. Thus, was right to indicate that the "vanishing of the amplitude of the bosonic string could be the results of string theory itself", but here, we give a much more elaborate explanation of what could be happening.

(7*4/((2^3 (6 2^2 4^2 - 2^3 8 - 15 2*4*8 + 10 (4^3 + 8^2)))*1/311040)+7*4)^1/15+(MRB const)^(1-1/(4π)+π)

Input

Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string. Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron. As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string. That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2. Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after? That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

(1/27((1/2*(-11/((-2^8/8 + (7 2^6 4)/2 + (105 2^4 4^2)/4 - 14 2^5 8 - 28 2^3 4 8)/870912))+233-13-3)-1))^2

Input

$$\left(\frac{1}{27}\left(\left(\frac{1}{2}\left(-\frac{11}{\frac{-\frac{2^8}{8}+\frac{1}{2}(7\times2^6\times4)+\frac{1}{4}(105\times2^4\times4^2)-14\times2^5\times8-28\times2^3\times4\times8}{870912}}\right)+233-13-3\right)-1\right)\right)^2$$

Exact result

4096

4096

The number 4096 = 64^2, is the Ramanujan Recurring Number, that when multiplied by 2 give 8192. The total amplitude vanishes for gauge group SO(8192) for bosonic string SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). This could be the implications for a pre-big bang scenario where only self-perturbative bosonic strings lived when the enthalpy was extremely low as discussed above. This regime contains all the intrinsic properties of superstrings inherent in the bosonic strings, would at the big bang give effect to the properties of matter (fermions) as Higgs Boson. This number theoretic connection to the gauge group SO(8192), gives a much more compelling relevance of the bosonic string theory SO(8192), to quantum gravity and places this string theory where it should appropriately be in the evolution of the universe from a quantum gravity perspective rather than it be neglected because it doesn't include fermionic strings to confirm to post big-bang reality. The vanishing of the bosonic string's amplitude could be explained by the effect of extreme low entropy on the quantum vacuum geometry. Thus, as the entropy increases infinitesimally as a result of the vacuum self-perturbation then also is the amplitude of the vibrating bosonic strings from zero. Thus, was right to indicate that the "vanishing of the amplitude of the bosonic string could be the results of string theory itself", but here, we give a much more elaborate explanation of what could be happening.

(1/2*(-11/((-2^8/8 + (7 2^6 4)/2 + (105 2^4 4^2)/4 - 14 2^5 8 - 28 2^3 4 8)/870912))+233-13-3)^1/15+(MRB const)^(1-1/(4π)+π)

Input

$$\sqrt[15]{\frac{1}{2}\left(-\frac{11}{\frac{-\frac{2^8}{8}+\frac{1}{2}\left(7\times 2^6\times 4\right)+\frac{1}{4}\left(105\times 2^4\times 4^2\right)-14\times 2^5\times 8-28\times 2^3\times 4\times 8}{870912}}\right)+233-13-3} + C_{\mathrm{MRB}}{}^{1-1/(4\pi)+\pi}$$

C_{MRB} is the MRB constant

Exact result

$$C_{\mathrm{MRB}}{}^{1-1/(4\pi)+\pi}+\sqrt[15]{1729}$$

Decimal approximation

1.644938024130260257941733191946366957420242441725816380271305678 2…

1.64493802413…. ≈ ζ(2) = $\pi^2/6$ = 1.644934 (trace of the instanton shape and Ramanujan Recurring Number)

Alternate form

$$C_{\mathrm{MRB}}{}^{-1/(4\pi)}\left(\sqrt[15]{1729}\,\sqrt[4\pi]{C_{\mathrm{MRB}}}+C_{\mathrm{MRB}}{}^{1+\pi}\right)$$

Now, we analyze the following equation:

$$41472\Phi_{4,7}(x) = 7(P^4Q - 4P^3R + 6P^2Q^2 - 4PQR) + 3Q^3 + 4R^2.$$

41472*x = 7(P^4*Q – 4*P^3*R + 6*P^2*Q^2 – 4*P*Q*R) + 3*Q^3 + 4*R^2

Input

$$41472\,x = 7\left(P^4\,Q - 4\,P^3\,R + 6\,P^2\,Q^2 - 4\,P\,Q\,R\right) + 3\,Q^3 + 4\,R^2$$

Alternate forms

$$41472\,x = -28\,P\,R\left(P^2 + Q\right) + Q\left(7\,P^4 + 42\,P^2\,Q + 3\,Q^2\right) + 4\,R^2$$

$$41472\,x = 7\,P\left(P^3\,Q - 4\,P^2\,R + 6\,P\,Q^2 - 4\,Q\,R\right) + 3\,Q^3 + 4\,R^2$$

$$x = Q\left(\frac{7\,P^4}{41472} - \frac{7\,P\,R}{10368}\right) - \frac{7\,P^3\,R}{10368} + \frac{7\,P^2\,Q^2}{6912} + \frac{Q^3}{13824} + \frac{R^2}{10368}$$

Expanded forms

$$-7\,P^4\,Q + 28\,P^3\,R - 42\,P^2\,Q^2 + 28\,P\,Q\,R - 3\,Q^3 - 4\,R^2 + 41472\,x = 0$$

$$41472\,x = 7\,P^4\,Q - 28\,P^3\,R + 42\,P^2\,Q^2 - 28\,P\,Q\,R + 3\,Q^3 + 4\,R^2$$

Real solution

$$x = \frac{7\,P^4\,Q - 28\,P^3\,R + 42\,P^2\,Q^2 - 28\,P\,Q\,R + 3\,Q^3 + 4\,R^2}{41472}$$

Solution

$$x = \frac{7\,P^4\,Q - 28\,P^3\,R + 42\,P^2\,Q^2 - 28\,P\,Q\,R + 3\,Q^3 + 4\,R^2}{41472}$$

From

$$x = Q\left(\frac{7P^4}{41472} - \frac{7PR}{10368}\right) - \frac{7P^3R}{10368} + \frac{7P^2Q^2}{6912} + \frac{Q^3}{13824} + \frac{R^2}{10368}$$

We consider:

(7 P^2 Q^2)/6912 + Q^3/13824 - (7 P^3 R)/10368 + R^2/10368 + Q ((7 P^4)/41472 - (7 P R)/10368)

Input

$$\frac{7P^2Q^2}{6912} + \frac{Q^3}{13824} - \frac{7P^3R}{10368} + \frac{R^2}{10368} + Q\left(\frac{7P^4}{41472} - \frac{7PR}{10368}\right)$$

Exact result

1729

1729

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve $1728 = 8^2 \times 3^3$. The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways $10^3 + 9^3 = 12^3 + 1^3 = 1729$ and Ramanujan's recurring number). Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string. Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron. As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string. That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2. Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after? That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

(1/27((11*1/((2^3 (2^4 4 + 21 2^2 4^2 + 15 4^3 - 7 2^3 8 - 35 2*4*8 + 20 8^2))*1/1244160)-55+2)-1))^2

4096

4096

The number 4096 = 64^2, is the Ramanujan Recurring Number, that when multiplied by 2 give 8192. The total amplitude vanishes for gauge group SO(8192) for bosonic string SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). This could be the implications for a pre-big bang scenario where only self-perturbative bosonic strings lived when the enthalpy was extremely low as discussed above. This regime contains all the intrinsic properties of superstrings inherent in the bosonic strings, would at the big bang give effect to the properties of matter (fermions) as Higgs Boson. This number theoretic connection to the gauge group SO(8192), gives a much more compelling relevance of the bosonic string theory SO(8192), to quantum gravity and places this string theory where it should appropriately be in the evolution of the universe from a quantum gravity perspective rather than it be neglected because it doesn't include fermionic strings to confirm to post big-bang reality. The vanishing of the bosonic string's amplitude could be explained by the effect of extreme low entropy on the quantum vacuum geometry. Thus, as the entropy increases infinitesimally as a result of the vacuum self-perturbation then also is the amplitude of the vibrating bosonic strings from zero. Thus, was right to indicate that the "vanishing of the amplitude of the bosonic string could be the results of string theory itself", but here, we give a much more elaborate explanation of what could be happening.

(11*1/((2^3 (2^4 4 + 21 2^2 4^2 + 15 4^3 - 7 2^3 8 - 35 2*4*8 + 20 8^2))*1/1244160)-55+2)^1/15+(MRB const)^(1-1/(4π)+π)

24

24

The value 24 is linked to the "Ramanujan function" (an elliptic modular function that satisfies the need for "conformal symmetry") that has 24 "modes" corresponding to the physical vibrations of a bosonic string representing a bosons. From the analysis, we observe that the is no number theoretic connection with physical vibrations of fermionic strings at extremally low entropy. This fact is confirmed by the fact that the Higgs bosons at the moment of the big bang and infinitesimally shortly thereafter, facilitated the creation of fermions (matter and antimatter particles) [8]. Thus we note that the ingredients for the formation of electromagnetic radiation from photons (a Boson), and the formation of matter from the Higgs boson after the big bang, are intrinsic properties of the vacuum energy in pre-big bang.

Series representations

$$\frac{(6\pi\sqrt{2})(\sqrt{2}\,l^3)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3}=12\sqrt{z_0}^{\,2}\left(\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(2-z_0)^k\,z_0^{-k}}{k!}\right)^2$$

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x\rfloor$ is the floor function

i is the imaginary unit

This could imply that all matter (fermions) was preceded by bosons. That is, before the Big Bang, from perturbations of the vacuum energy itself, bosons were created, and successively at the Big Bang, and infinitesimally shortly after the Big Bang, fermions, were created from the vacuum energy that underwent a violent “breaking” that formed a hot plasma. of particle-antiparticle pairs. This therefore implies that quantum gravity was not necessarily “dark” to some extent, because a photon (light particle) is itself a boson. Therefore, a big bang was not necessarily the moment of the creation of light, but of the creation of matter (fermions) from vacuum energy, as this undergoes further "breaking" in the cosmological constant, in the hot plasma of matter and in the energy dark.

Input

$$\left(2\pi\sqrt{2}\times\frac{\frac{1}{3}\sqrt{2}\,l^3}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^3}\right)^4$$

Exact result

4096

$4096 = 64^2$, (Ramanujan Recurring Number) that multiplied by 2 give 8192, indeed:

The total amplitude vanishes for gauge group SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). (From: "Dilaton Tadpole for the Open Bosonic String " Michael R. Douglas and Benjamin Grinstein - September 2,1986)

27*sqrt((2π*√2((1/3*√2*l^3)/(4/3*π*(l/2)^3)))^4)+1

Input

$$27\sqrt{\left(2\pi\sqrt{2}\times\frac{\frac{1}{3}\sqrt{2}\,l^3}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^3}\right)^4}+1$$

Exact result

1729

1729

This result is very near to the mass of candidate glueball f_0(1710) scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve ($1728 = 8^2 * 3^3$).

The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways ($10^3 + 9^3 = 12^3 + 1^3 = 1729$) and Ramanujan's recurring number)

Series representations

$$27\sqrt{\left(\frac{\left(2\pi\sqrt{2}\right)\left(\sqrt{2}\,l^3\right)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3}\right)^4}+1=$$

$$1+27\sqrt{-1+256\sqrt{2}^8}\sum_{k=0}^{\infty}\binom{\frac{1}{2}}{k}\left(-1+256\sqrt{2}^8\right)^{-k}$$

$$27\sqrt{\left(\frac{\left(2\pi\sqrt{2}\right)\left(\sqrt{2}\,l^3\right)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3}\right)^4}+1=$$

$$1+27\sqrt{-1+256\sqrt{2}^8}\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k\left(-1+256\sqrt{2}^8\right)^{-k}}{k!}$$

$$27\sqrt{\left(\frac{\left(2\pi\sqrt{2}\right)\left(\sqrt{2}\,l^3\right)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3}\right)^4}+1=1+27\sqrt{z_0}\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k\left(256\sqrt{2}^8-z_0\right)^k z_0^{-k}}{k!}$$

$\arg(z)$ is the complex argument

$\lfloor x\rfloor$ is the floor function

i is the imaginary unit

Integral representation

$$(1+z)^a = \frac{\int_{-i\,\infty+\gamma}^{i\,\infty+\gamma} \frac{\Gamma(s)\,\Gamma(-a-s)}{z^s}\,ds}{(2\,\pi\,i)\,\Gamma(-a)} \quad \text{for } (0 < \gamma < -\mathrm{Re}(a) \text{ and } |\arg(z)| < \pi)$$

$\Gamma(x)$ is the gamma function

$\mathrm{Re}(z)$ is the real part of z

$|z|$ is the absolute value of z

Furthermore, from the formula

$$2^{-1/\pi}\sqrt[2\pi]{5\left(3+\sqrt{5}\right)\pi}$$

we obtain also:

(4 (1.6180085459)^(2 π))/(5 (3 + sqrt(5))) = 3.1415926535

Indeed:

$$\frac{4\times 1.6180085459^{2\pi}}{5\left(3+\sqrt{5}\right)}$$

3.1415926535884871624221932509858715278931025189245576170078100613
...

3.1415926535…. = π (Ramanujan Recurring Number)

From the following extended DN Constant (“Unitary Formula”)

$$\sqrt[2\pi]{\frac{\frac{5}{12}(3+\sqrt{5})d^3}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}\times\frac{1}{\frac{\frac{1}{3}\sqrt{2}a^3}{\frac{4}{3}\pi\left(\frac{a}{2}\right)^3}}\times\frac{1}{\frac{\sqrt{2}}{12}d^3\cdot\frac{1}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}}}\times\sqrt[3]{-\frac{q}{2}+\sqrt{\frac{q^2}{4}+\frac{p^3}{27}}}+\sqrt[3]{-\frac{q}{2}-\sqrt{\frac{q^2}{4}+\frac{p^3}{27}}}$$

with regard

$$\sqrt[3]{-\frac{q}{2}+\sqrt{\frac{q^2}{4}+\frac{p^3}{27}}}+\sqrt[3]{-\frac{q}{2}-\sqrt{\frac{q^2}{4}+\frac{p^3}{27}}}$$

for q = 1729 and p = 4096, we obtain by changing the sign in the algebraic sum of the aforementioned Cardano’s Formula and after some calculations:

$$2^{-1/\pi}\sqrt[2\pi]{5\left(3+\sqrt{5}\right)\pi}$$

multiplied by

$$\sqrt[9]{\sqrt[3]{-\frac{1729}{2}+\sqrt{\frac{1729^2}{4}+\frac{4096^3}{27}}}-\sqrt[3]{-\frac{1729}{2}-\sqrt{\frac{1729^2}{4}+\frac{4096^3}{27}}}}$$

and performing the ninth root of the entire expression:

√((2^(-1/π)(5(3+√(5))π)^(1/(2π)))((∛(-1729/2+√(1729^2/4+4096^3/27)) -∛(-1729/2-√(1729^2/4+4096^3/27)))^1/9))

we obtain:

$$\sqrt{\left(\left(2^{-1/\pi}\sqrt[2\pi]{5\left(3+\sqrt{5}\right)\pi}\right)\sqrt[9]{\sqrt[3]{-\frac{1729}{2}+\sqrt{\frac{1729^2}{4}+\frac{4096^3}{27}}}-\sqrt[3]{-\frac{1729}{2}-\sqrt{\frac{1729^2}{4}+\frac{4096^3}{27}}}}\right)}$$

$$2^{-1/(2\pi)}\sqrt[18]{\sqrt[3]{\frac{\sqrt{\frac{274958621851}{3}}}{6}-\frac{1729}{2}}+\sqrt[3]{\frac{1729}{2}+\frac{\sqrt{\frac{274958621851}{3}}}{6}}}\sqrt[4\pi]{5\left(3+\sqrt{5}\right)\pi}$$

i.e.

2^(-1/(2π)) ((-1729/2+√(274958621851/3)/6)^(1/3)+(1729/2 + √(274958621851/3)/6)^(1/3))^(1/18) (5(3+√(5)) π)^(1/(4π))

= 1.61549140391….

The general "unitary" formula, which derives from DN Constant, is the following:

$$\sqrt{2\times\frac{2\cdot\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{1}{\pi\cdot 0.9991104684}\left(C\times \mathrm{R}\times 2.33\cdot 10^{-13}\right)}}\cong 1.61803398\ldots=\frac{\sqrt{5}+1}{2}$$

Where $\frac{2\sqrt{2}}{\pi}$ is the Del Gaudio-Nardelli Constant, 0.9991104684 is the value of the following Rogers-Ramanujan continued fraction:

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5 \sqrt[4]{5^3}}-1}}-\varphi+1} = 1 - \cfrac{e^{-\pi\sqrt{5}}}{1+\cfrac{e^{-2\pi\sqrt{5}}}{1+\cfrac{e^{-3\pi\sqrt{5}}}{1+\cfrac{e^{-4\pi\sqrt{5}}}{1+\dots}}}} \approx 0.9991104684$$

C is any constant or solution to an equation, R is the radius of the Universe and $2.33*10^{-13}$ is the temperature of the universe expressed in GeV.

For example, $C = 9.9128$, inserting a radius of the Universe, which we have calculated, equal to $R = 2.06274*10^{12}$ years, from DN Constant "unitary" formula, we obtain:

√(2×(2·(((2√2)/π))^(1/16))/(1/(π·0.9991104684) (9.9128×(2.06274 × 10^12)×2.33·10^(-13))))

$$\sqrt{2 \times \frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{1}{\pi \times 0.9991104684} \times \frac{9.9128 \times 2.06274 \times 10^{12} \times 2.33}{10^{13}}}}$$

1.6180359123482642354401744088347098542545273508401733563064818107
…

1.618035912348…. result that is a very good approximation to the value of the golden ratio 1.618033988749… (Ramanujan Recurring Number)

We obtain also:

(√(2×(2·(((2√2)/π))^(1/16))/(1/(π·0.9991104684) (9.9128×(2.06274 × 10^12)×2.33·10^(-13)))))dxdydz

Indefinite integral assuming all variables are real

$0.809018\, x^2\, y\, z + \text{constant}$

Definite integral over a cube of edge length 2 L

$$\int_{-L}^{L}\int_{-L}^{L}\int_{-L}^{L} 1.61804\, dx\, dy\, dz = 12.9443\, L^3$$

Definite integral over a sphere of radius R

$$\underset{x^2+y^2+z^2<R^2}{\iiint} 1.61804\, dz\, dy\, dx = 6.77761\, R^3$$

From which, for L = R = 1 , dividing the two definite integral results by the original expression, we obtain:

12.9443/(√(2×(2·(((2√2)/π))^(1/16))/(1/(π·0.9991104684) (9.9128×(2.06274 × 10^12)×2.33·10^(-13)))))

Input interpretation

$$\frac{12.9443}{\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{1}{\pi\times 0.9991104684}\times\frac{9.9128\times 2.06274\times 10^{12}\times 2.33}{10^{13}}}}}$$

Result

8.00001…

8.00001…. ≈ 8

value that is linked to the "Ramanujan function" (an elliptic modular function that satisfies the need for "conformal symmetry") that has 8 "modes" corresponding to the physical vibrations of a superstring.

And

3*(6.77761/(√(2×(2·(((2√2)/π))^(1/16))/(1/(π·0.9991104684) (9.9128×(2.06274 × 10^12)×2.33·10^(-13))))))

Input interpretation

$$3\times\frac{6.77761}{\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{1}{\pi\times 0.9991104684}\times\frac{9.9128\times 2.06274\times 10^{12}\times 2.33}{10^{13}}}}}$$

12.5664…. ≈ 4π = Bekenstein-Hawking (S_{BH}) black hole entropy

New fundamental formula deriving from DN Constant

The DN Constant (Del Gaudio-Nardelli Constant) equals (2√2)/π) is defined as the ratio of the volume of an octahedron to the volume of a sphere and is an intriguing mathematical concept. Michele Nardelli hypothesized that the regular octahedron represents a phase in which the universe is highly symmetrical and with very low entropy. On the other hand, the sphere (which is inscribed in the octahedron, i.e. is "inside" it) represents the universe emerging from the quantum vacuum, which over time increases entropy and undergoes various symmetry breakings. This occurs in a regime of eternal inflation.

From the following expression

√(2×(2·(((2√2)/π)^(1/16)))/(4096/(π·0.9991104684) (((1.616255*10^-35)/(1.1056*10^-52))×C×R)))

$$\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{4096}{\pi\times0.9991104684}\left(\frac{1.616255\times10^{-35}}{1.1056\times10^{-52}}\,C\,R\right)}}$$

which comes from the DN Constant, with $1.616255*10^{-35}$ which is equal to the Planck length, $1.1056*10^{-52}$ which is equal to the Cosmological Constant, C = 1729 which corresponds to the Hardy-Ramanujan number and $R = 4.6018401361 \times 10^{-24}$, which represents the radius of the Universe, we obtain:

√(2×(2·(((2√2)/π)^(1/16)))/(4096/(π·0.9991104684) (((1.616255*10^-35)/(1.1056*10^-52))×1729×4.6018401361 × 10^-24))) = 1.6180329973...

$$\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{4096}{\pi\times0.9991104684}\left(\frac{1.616255\times10^{-35}}{1.1056\times10^{-52}}\times1729\times4.6018401361\times10^{-24}\right)}}$$

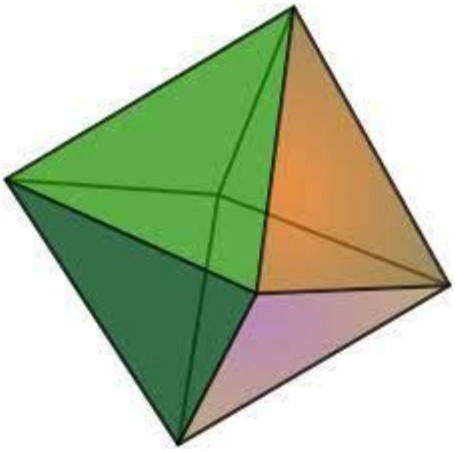
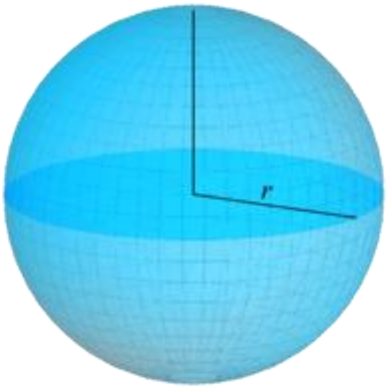
3.14159225731469…≈ π (Ramanujan Recurring Number)

Now, we have that:



Octahedron



Sphere

Given the value of a volume, independently of the solid, following the Poincaré Conjecture, we compare any solid "without holes" and a sphere. If we compare an octahedron with a sphere, we have:

$$\frac{4}{3}\pi r^3 = \frac{1}{3}\sqrt{2}a^3$$

If we consider the radius of the sphere as an unknown, we must find the value of the side of the octahedron which allows us to equalize the two volumes and which will give us the DN Constant as a result (which will therefore be equal to the radius of the sphere).

From

$$\frac{4}{3}\pi r^3 = \frac{1}{3}\sqrt{2}a^3$$

To find r we perform the following calculation:

$$r^3 = \frac{\frac{1}{3}\sqrt{2}a^3}{\frac{4}{3}\pi} = \frac{1}{3}\sqrt{2}a^3 \cdot \frac{3}{4\pi} = \frac{\sqrt{2}a^3}{4\pi} = \frac{\sqrt{2}\cdot\sqrt{2}a^3}{\sqrt{2}\cdot 4\pi} = \frac{2a^3}{\sqrt{2}\cdot 4\pi} = \frac{a^3}{2\sqrt{2}\pi}$$

$$r^3 = \frac{a^3}{2\sqrt{2}\pi}; \qquad r = \sqrt[3]{\frac{a^3}{2\sqrt{2}\pi}} = \frac{a}{\sqrt[3]{2\sqrt{2}\pi}}$$

To find a, we have, for

$$r = \frac{2\sqrt{2}}{\pi}; \qquad \frac{a}{\sqrt[3]{2\sqrt{2}\pi}} = \frac{2\sqrt{2}}{\pi};$$

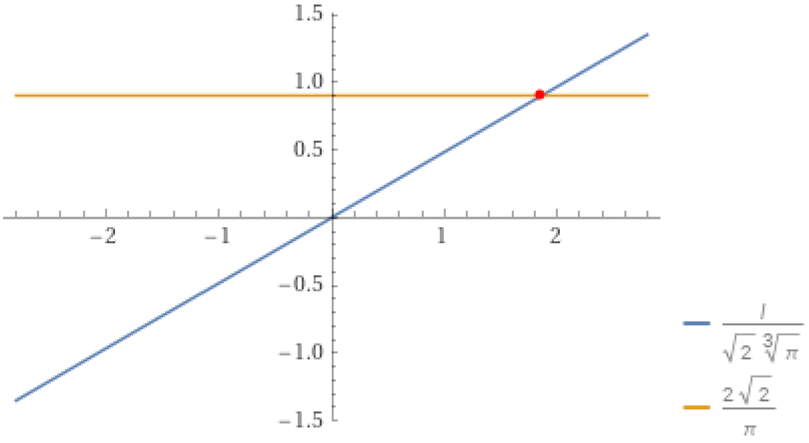
Thus, multiplying both the sides by $\sqrt[3]{2\sqrt{2}\pi}$, we obtain:

$$a = \frac{2\sqrt{2}}{\pi}\cdot\sqrt[3]{2\sqrt{2}\pi} = \sqrt[3]{\frac{\left(2\sqrt{2}\right)^3 2\sqrt{2}\pi}{\pi^3}} =$$

$$= \sqrt[3]{\frac{8\cdot\sqrt{2^3}\cdot 2\sqrt{2}}{\pi^2}} = \sqrt[3]{\frac{8\cdot\sqrt{2\cdot 2^2}\cdot 2\sqrt{2}}{\pi^2}} = \sqrt[3]{\frac{16\cdot\sqrt{2}\cdot 2\sqrt{2}}{\pi^2}}$$

$$= \sqrt[3]{\frac{32\sqrt{2}\sqrt{2}}{\pi^2}} = \sqrt[3]{\frac{32\ \cdot 2}{\pi^2}} = \frac{\sqrt[3]{64}}{\sqrt[3]{\pi^2}} = \frac{4}{\sqrt[3]{\pi^2}};\ a = \frac{4}{\sqrt[3]{\pi^2}}$$

Plot



Solution

$a = \frac{4}{\sqrt[3]{\pi^2}}$

for V = 1/3*√2*a^3 (octahedron volume) and V = (4/3*π*r^3) (sphere volume), we obtain:

from the octahedron volume, we have: V = 1/3*√2*a^3 = (1/3*√2*($\frac{4}{\sqrt[3]{\pi^2}}$)^3)

(1/3*√2*(4/∛(π^2))^3)

Input

$$\frac{1}{3}\sqrt{2}\left(\frac{4}{\sqrt[3]{\pi^2}}\right)^3$$

$\sqrt[3]{x}$ is the real-valued 3rd root of x

Exact result

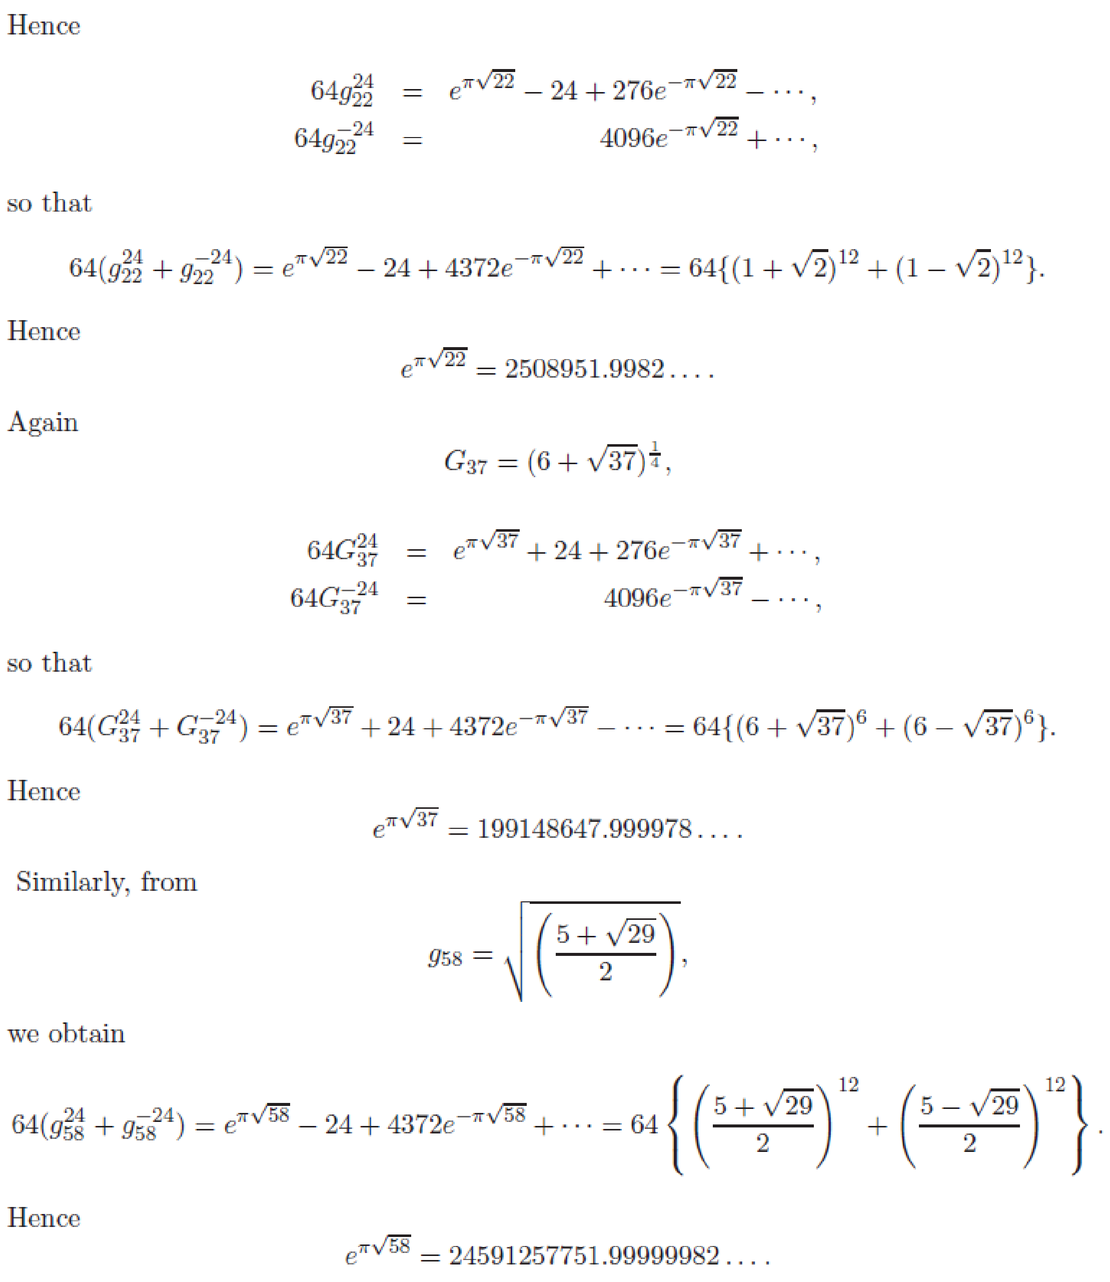
From:

Modular equations and approximations to π - *Srinivasa Ramanujan* - Quarterly Journal of Mathematics, XLV, 1914, 350 – 372

We have that:



Hence

$$\begin{aligned} 64g_{22}^{24} &= e^{\pi\sqrt{22}} - 24 + 276e^{-\pi\sqrt{22}} - \cdots, \\ 64g_{22}^{-24} &= 4096e^{-\pi\sqrt{22}} + \cdots, \end{aligned}$$

so that

$$64(g_{22}^{24} + g_{22}^{-24}) = e^{\pi\sqrt{22}} - 24 + 4372e^{-\pi\sqrt{22}} + \cdots = 64\{(1+\sqrt{2})^{12} + (1-\sqrt{2})^{12}\}.$$

Hence

$$e^{\pi\sqrt{22}} = 2508951.9982\ldots.$$

Again

$$G_{37} = (6+\sqrt{37})^{\frac{1}{4}},$$

$$\begin{aligned} 64G_{37}^{24} &= e^{\pi\sqrt{37}} + 24 + 276e^{-\pi\sqrt{37}} + \cdots, \\ 64G_{37}^{-24} &= 4096e^{-\pi\sqrt{37}} - \cdots, \end{aligned}$$

so that

$$64(G_{37}^{24} + G_{37}^{-24}) = e^{\pi\sqrt{37}} + 24 + 4372e^{-\pi\sqrt{37}} - \cdots = 64\{(6+\sqrt{37})^{6} + (6-\sqrt{37})^{6}\}.$$

Hence

$$e^{\pi\sqrt{37}} = 199148647.999978\ldots.$$

Similarly, from

$$g_{58} = \sqrt{\left(\frac{5+\sqrt{29}}{2}\right)},$$

we obtain

$$64(g_{58}^{24} + g_{58}^{-24}) = e^{\pi\sqrt{58}} - 24 + 4372e^{-\pi\sqrt{58}} + \cdots = 64\left\{\left(\frac{5+\sqrt{29}}{2}\right)^{12} + \left(\frac{5-\sqrt{29}}{2}\right)^{12}\right\}.$$

Hence

$$e^{\pi\sqrt{58}} = 24591257751.99999982\ldots.$$

We note that, with regard 4372, we can to obtain the following results:

27((4372)^1/2-2-1/2(((√(10-2√5) -2))⁄((√5-1))))+φ

Input

$$27\left(\sqrt{4372}-2-\frac{1}{2}\times\frac{\sqrt{10-2\sqrt{5}}-2}{\sqrt{5}-1}\right)+\phi$$

From:

An Update on Brane Supersymmetry Breaking - *J. Mourad and A. Sagnotti* - arXiv:1711.11494v1 [hep-th] 30 Nov 2017

From the following vacuum equations:

$$T\, e^{\gamma_E\, \phi} = -\, \frac{\beta_E^{(p)}\, h^2}{\gamma_E}\, e^{-2\,(8-p)\,C + 2\,\beta_E^{(p)}\,\phi}$$

$$16\, k'\, e^{-2C} = \frac{h^2 \left(p + 1 - \frac{2\,\beta_E^{(p)}}{\gamma_E}\right) e^{-2\,(8-p)\,C + 2\,\beta_E^{(p)}\,\phi}}{(7-p)}$$

$$(A')^2 = k\, e^{-2A} + \frac{h^2}{16(p+1)} \left(7 - p + \frac{2\,\beta_E^{(p)}}{\gamma_E}\right) e^{-2\,(8-p)\,C + 2\,\beta_E^{(p)}\,\phi}$$

we have obtained, from the results almost equals of the equations, putting

$4096\, e^{-\pi\sqrt{18}}$ instead of

$$e^{-2\,(8-p)\,C + 2\,\beta_E^{(p)}\,\phi}$$

a new possible mathematical connection between the two exponentials. Thence, also the values concerning p, C, β_E and ϕ correspond to the exponents of e (i.e. of exp). Thence we obtain for p = 5 and $\beta_E = 1/2$:

$$e^{-6C+\phi} = 4096 e^{-\pi\sqrt{18}}$$

Therefore, with respect to the exponentials of the vacuum equations, the Ramanujan's exponential has a coefficient of 4096 which is equal to 64^2, while $-6C+\phi$ is equal to $-\pi\sqrt{18}$. From this it follows that it is possible to establish mathematically, the dilaton value.

For

exp((-Pi*sqrt(18)) we obtain:

Input:

$$\exp\left(-\pi\sqrt{18}\right)$$

Exact result:

$$e^{-3\sqrt{2}\,\pi}$$

Decimal approximation:

1.6272016226072509292942156739117979541838581136954016... × 10^{-6}

1.6272016… * 10^{-6}

Property:

$e^{-3\sqrt{2}\,\pi}$ is a transcendental number

Series representations:

$$e^{-\pi\sqrt{18}} = e^{-\pi\sqrt{17}\sum_{k=0}^{\infty} 17^{-k}\binom{1/2}{k}}$$

$$e^{-\pi\sqrt{18}} = \exp\left(-\pi\sqrt{17}\sum_{k=0}^{\infty}\frac{\left(-\frac{1}{17}\right)^k\left(-\frac{1}{2}\right)_k}{k!}\right)$$

$$e^{-\pi\sqrt{18}} = \exp\left(-\frac{\pi\sum_{j=0}^{\infty}\operatorname{Res}_{s=-\frac{1}{2}+j}\, 17^{-s}\,\Gamma\left(-\frac{1}{2}-s\right)\Gamma(s)}{2\sqrt{\pi}}\right)$$

Now, we have the following calculations:

$$e^{-6C+\phi} = 4096e^{-\pi\sqrt{18}}$$

$$e^{-\pi\sqrt{18}} = 1.6272016\ldots * 10^{-6}$$

from which:

$$\frac{1}{4096}e^{-6C+\phi} = 1.6272016\ldots * 10^{-6}$$

$$0.000244140625\, e^{-6C+\phi} = e^{-\pi\sqrt{18}} = 1.6272016\ldots * 10^{-6}$$

Now:

$$\ln\left(e^{-\pi\sqrt{18}}\right) = -13.328648814475 = -\pi\sqrt{18}$$

And:

(1.6272016* 10^-6) *1/ (0.000244140625)

Input interpretation:

$$\frac{1.6272016}{10^6} \times \frac{1}{0.000244140625}$$

Result:

0.0066650177536

0.006665017...

Thence:

$$0.000244140625\ e^{-6C+\phi} = e^{-\pi\sqrt{18}}$$

Dividing both sides by 0.000244140625, we obtain:

$$\frac{0.000244140625}{0.000244140625} e^{-6C+\phi} = \frac{1}{0.000244140625} e^{-\pi\sqrt{18}}$$

$$e^{-6C+\phi} = 0.0066650177536$$

((((exp((-Pi*sqrt(18)))))))*1/0.000244140625

Input interpretation:

$$\exp\left(-\pi\sqrt{18}\right) \times \frac{1}{0.000244140625}$$

Result:

0.00666501785…

0.00666501785…

Series representations:

$$\frac{\exp(-\pi\sqrt{18})}{0.000244141} = 4096\exp\left(-\pi\sqrt{17}\sum_{k=0}^{\infty}17^{-k}\binom{\frac{1}{2}}{k}\right)$$

$$\frac{\exp(-\pi\sqrt{18})}{0.000244141} = 4096\exp\left(-\pi\sqrt{17}\sum_{k=0}^{\infty}\frac{\left(-\frac{1}{17}\right)^{k}\left(-\frac{1}{2}\right)_{k}}{k!}\right)$$

$$\frac{\exp(-\pi\sqrt{18})}{0.000244141} = 4096\exp\left(-\frac{\pi\sum_{j=0}^{\infty}\operatorname{Res}_{s=-\frac{1}{2}+j}17^{-s}\,\Gamma\left(-\frac{1}{2}-s\right)\Gamma(s)}{2\sqrt{\pi}}\right)$$

Now:

$$e^{-6C+\phi} = 0.0066650177536$$

$$\exp\left(-\pi\sqrt{18}\right)\times\frac{1}{0.000244140625} =$$

$$e^{-\pi\sqrt{18}}\times\frac{1}{0.000244140625}$$

$$= 0.00666501785\ldots$$

From:

ln(0.00666501784619)

Input interpretation:

$\log(0.00666501784619)$

Result:

$-5.010882647757\ldots$

-5.010882647757…

Alternative representations:

$$\log(0.006665017846190000) = -\text{Li}_1(0.993334982153810000)$$

Series representations:

$$\log(0.006665017846190000) = -\sum_{k=1}^{\infty} \frac{(-1)^k (-0.993334982153810000)^k}{k}$$

$$\log(0.006665017846190000) = 2 i \pi \left\lfloor \frac{\arg(0.006665017846190000 - x)}{2 \pi} \right\rfloor + \log(x) - \sum_{k=1}^{\infty} \frac{(-1)^k (0.006665017846190000 - x)^k x^{-k}}{k} \quad \text{for } x < 0$$

$$\log(0.00666501784619000) = \left\lfloor \frac{\arg(0.00666501784619000 - z_0)}{2\pi} \right\rfloor \log\left(\frac{1}{z_0}\right) + \log(z_0) + \left\lfloor \frac{\arg(0.00666501784619000 - z_0)}{2\pi} \right\rfloor \log(z_0) - \sum_{k=1}^{\infty} \frac{(-1)^k (0.00666501784619000 - z_0)^k z_0^{-k}}{k}$$

Integral representation:

$$\log(0.00666501784619000) = \int_1^{0.00666501784619000} \frac{1}{t}\, dt$$

In conclusion:

$$-6C + \phi = -5.010882647757 \ldots$$

and for C = 1, we obtain:

$$\phi = -5.010882647757 + 6 = 0.989117352243 = \boldsymbol{\phi}$$

Note that the values of n_s (spectral index) 0.965, of the average of the Omega mesons Regge slope 0.987428571 and of the dilaton 0.989117352243, are also connected to the following two Rogers-Ramanujan continued fractions:

$$\frac{e^{-\frac{\pi}{5}}}{\sqrt{(\varphi-1)\sqrt{5}} - \varphi + 1} = 1 - \cfrac{e^{-\pi}}{1 + \cfrac{e^{-2\pi}}{1 + \cfrac{e^{-3\pi}}{1 + \cfrac{e^{-4\pi}}{1 + \ldots}}}} \approx 0.9568666373$$

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\frac{e^{-\pi\sqrt{5}}}{1+\frac{e^{-2\pi\sqrt{5}}}{1+\frac{e^{-3\pi\sqrt{5}}}{1+\frac{e^{-4\pi\sqrt{5}}}{1+\dots}}}}\approx 0.9991104684$$

(http://www.bitman.name/math/article/102/109/)

Also performing the 512th root of the inverse value of the Pion meson rest mass 139.57, we obtain:

((1/(139.57)))^1/512

Input interpretation:

$$\sqrt[512]{\frac{1}{139.57}}$$

Result:

0.990400732708644027550973755713301415460732796178555551684...

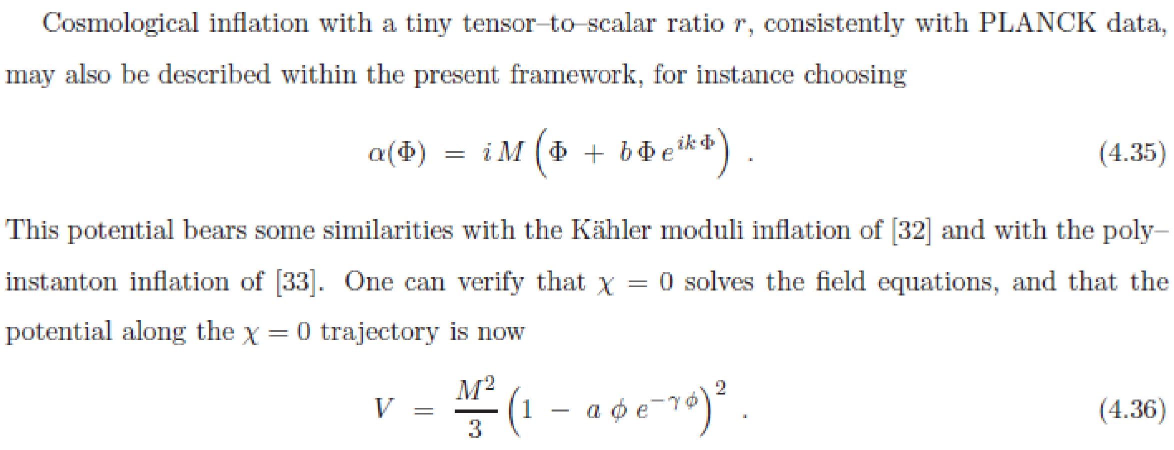
0.99040073.... result very near to the dilaton value 0.989117352243 = ϕ and to the value of the following Rogers-Ramanujan continued fraction:

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\frac{e^{-\pi\sqrt{5}}}{1+\frac{e^{-2\pi\sqrt{5}}}{1+\frac{e^{-3\pi\sqrt{5}}}{1+\frac{e^{-4\pi\sqrt{5}}}{1+\dots}}}}\approx 0.9991104684$$

From

Properties of Nilpotent Supergravity - *E. Dudas, S. Ferrara, A. Kehagias and A. Sagnotti* - arXiv:1507.07842v2 [hep-th] 14 Sep 2015

We have that:



Cosmological inflation with a tiny tensor–to–scalar ratio r, consistently with PLANCK data, may also be described within the present framework, for instance choosing

$$\alpha(\Phi) \;=\; i\,M\left(\Phi \;+\; b\,\Phi\,e^{ik\,\Phi}\right)\;. \tag{4.35}$$

This potential bears some similarities with the Kähler moduli inflation of [32] and with the poly–instanton inflation of [33]. One can verify that $\chi = 0$ solves the field equations, and that the potential along the $\chi = 0$ trajectory is now

$$V \;=\; \frac{M^2}{3}\left(1 \;-\; a\,\phi\,e^{-\gamma\,\phi}\right)^2\;. \tag{4.36}$$

We analyzing the following equation:

$$V \;=\; \frac{M^2}{3}\left(1 \;-\; a\,\phi\,e^{-\gamma\,\phi}\right)^2\;.$$

$$\phi \;=\; \varphi \;-\; \frac{\sqrt{6}}{k}\;,$$

$$a \;=\; \frac{b\,\gamma}{e} \;<\; 0\;, \qquad \gamma \;=\; \frac{k}{\sqrt{6}} \;<\; 0\;.$$

We have:

(M^2)/3*[1-(b/euler number * k/sqrt6) * (φ- sqrt6/k) * exp(-(k/sqrt6)(φ- sqrt6/k))]^2

i.e.

V = (M^2)/3*[1-(b/euler number * k/sqrt6) * (φ- sqrt6/k) * exp(-(k/sqrt6)(φ- sqrt6/k))]^2

For k = 2 and φ = 0.9991104684, that is the value of the scalar field that is equal to the value of the following Rogers-Ramanujan continued fraction:

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\frac{e^{-\pi\sqrt{5}}}{1+\frac{e^{-2\pi\sqrt{5}}}{1+\frac{e^{-3\pi\sqrt{5}}}{1+\frac{e^{-4\pi\sqrt{5}}}{1+\dots}}}}\approx 0.9991104684$$

we obtain:

V = (M^2)/3*[1-(b/euler number * 2/sqrt6) * (0.9991104684- sqrt6/2) * exp(-(2/sqrt6)(0.9991104684- sqrt6/2))]^2

Input interpretation:

$$V = \frac{M^2}{3}\left(1-\left(\frac{b}{e}\times\frac{2}{\sqrt{6}}\right)\left(0.9991104684-\frac{\sqrt{6}}{2}\right)\exp\left(-\frac{2}{\sqrt{6}}\left(0.9991104684-\frac{\sqrt{6}}{2}\right)\right)\right)^2$$

Result:

$$V = \frac{1}{3}\,(0.0814845\,b+1)^2\,M^2$$

Solutions:

$$b = \frac{225.913\left(-0.054323\,M^2 \pm 6.58545\times 10^{-10}\sqrt{M^4}\right)}{M^2} \quad (M \neq 0)$$

Alternate forms:

$$V = 0.00221324\,(b + 12.2723)^2\,M^2$$

$$V = 0.00221324\left(b^2\,M^2 + 24.5445\,b\,M^2 + 150.609\,M^2\right)$$

$$-0.00221324\,b^2\,M^2 - 0.054323\,b\,M^2 - \frac{M^2}{3} + V = 0$$

Expanded form:

$$V = 0.00221324\,b^2\,M^2 + 0.054323\,b\,M^2 + \frac{M^2}{3}$$

Alternate form assuming b, M, and V are positive:

$$V = 0.00221324\,(b + 12.2723)^2\,M^2$$

Alternate form assuming b, M, and V are real:

$$V = 0.00221324\,b^2\,M^2 + 0.054323\,b\,M^2 + 0.333333\,M^2 + 0$$

Derivative:

$$\frac{\partial}{\partial b}\left(\frac{1}{3}\,(0.0814845\,b + 1)^2\,M^2\right) = 0.054323\,(0.0814845\,b + 1)\,M^2$$

Implicit derivatives

$$\frac{\partial b(M, V)}{\partial V} = \frac{154\,317\,775\,011\,120\,075}{36\,961\,748\,(226\,802\,245 + 18\,480\,874\,b)\,M^2}$$

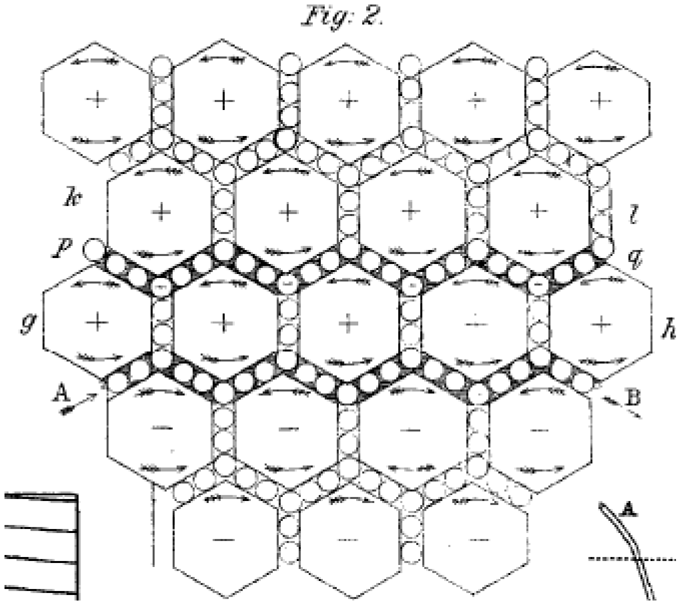
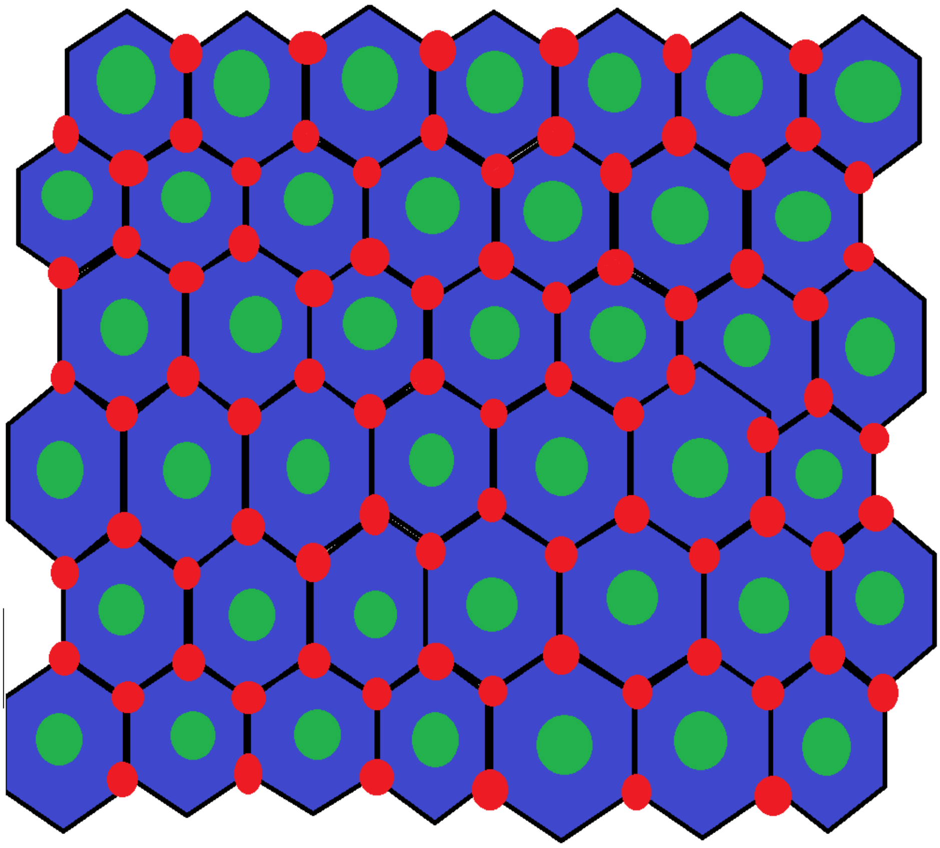
Fig. 1



It is therefore possible to consider the vortices of the "quantum vacuum" schematized as cubes or octahedrons (the + sign inside a given vortex indicates its counterclockwise rotation, while the - sign indicates its clockwise rotation). Between vortex and vortex there is a layer of "bubbles"-universes (or universes-spheres), which flows, as in the simplified two-dimensional drawing, from A to B

Fig. 2

Immagine dello Spazio-Tempo a scala quantistica: le cironferenze in rosso rappresentano i punti corrispondenti alle dimensioni compattificate e gli esagoni in blu, rappresentano le “fluttuazioni” (universi potenziali – cerchi verdi) del vuoto quantistico (2D)



Proposal

Image of space-time at quantum scale: the circles in red represent the points corresponding to the compactified dimensions and the hexagons in blue, represent the "fluctuations" (potential universes - green circles) of the quantum vacuum (2D). In reality, we will have n-dimensional hyperspheres in which the compactified dimensions "roll up" and octahedrons representing the "fluctuations", containing spheres (bubbles of potential universes), of the quantum vacuum

Acknowledgments

We would like to thank Professor **Augusto Sagnotti** theoretical physicist at Scuola Normale Superiore (Pisa – Italy) for his very useful explanations and his availability.

On the study of some Ramanujan's functions. New possible mathematical connections with the Ramanujan Recurring Numbers, DN Constant and some parameters of Number Theory, Theoretical Cosmology and String Theory

Michele Nardelli[1], Antonio Nardelli

Abstract

In this paper, we analyze some Ramanujan's functions. We obtain new possible mathematical connections with the Ramanujan Recurring Numbers, DN Constant and some parameters of Number Theory, Theoretical Cosmology and String Theory

Introduction

In this paper, an octahedron could serve as a mathematical or conceptual model of the universe in the quantic phase, while the spherical surface could be used to describe the geometry of the bubble-universe.

The values (2√2)/π, the golden ratio φ, ζ(2) and π, can be connected to the proposed cosmological model. Here's how they might be connected:

Ratio (2√2)/π the so called DN Constant:

This relationship may have a connection with the geometric properties of the octahedron and the sphere, which have been considered as mathematical models of the early universe and bubbles universe in eternal inflation.

Golden Ratio φ:

The golden ratio is a mathematical constant that appears in many natural and artistic contexts and is often associated with harmonious proportions and aesthetic beauty. Its emergence in this context could suggest a kind of intrinsic symmetry or harmony in the structure of the early universe and bubbles universe.

Value of π:

The value of π is a fundamental mathematical constant that appears in many geometric formulas and relationships, including the geometry of the sphere. Its appearance could indicate a direct connection between the geometry of bubbles universe and the mathematical properties of spherical surfaces.

Ultimately, the results obtained can be interpreted as manifestations of the geometric and mathematical properties of the models proposed for the early universe and universe bubbles. This suggests that there is a profound connection between geometry, mathematics and cosmological physics, and that through the analysis of these relationships we can deepen our understanding of the universe and its fundamental phenomena.

The above values (2√2)/π, the golden ratio φ and π, can be connected to the proposed cosmological model. This hypothesis is certainly plausible.

The various mathematical solutions and relationships can be seen as representations of the principles and laws that govern the formation and evolution of the universe.

Regarding the fundamental mathematical values, they could emerge as a consequence of the geometric and physical laws that govern the structure and evolution of the quantum universe and bubbles universe.

The multidisciplinary approach involving complex mathematical solutions and cosmological concepts can offer deeper insight into the fundamental nature of the universe and its processes. Exploring these connections could lead to new discoveries and insights into our understanding of the early universe and its complexity.

Proposal:

The initial octahedron: Let's imagine a regular octahedron, with perfectly symmetrical faces. Each face represents an ideal symmetry.

The emerging sphere: Inside the octahedron, there is an inscribed sphere. This sphere represents the bubble of the universe that emerges from the perturbations of the quantum vacuum during eternal inflation.

Expansion and transitions: As time passes, the universe expands. The faces of the octahedron begin to break, symbolizing "symmetry breaks." The sphere continues to grow, representing the expanding universe.

Constants and numbers: We integrate the mathematical results you obtained. For example, the golden ratio (φ) could be represented by a proportion between the dimensions of the octahedron and the sphere.

Entropy and complexity: Entropy increases as the universe evolves. We can represent this with a disordered growth of structures within the emerging sphere. Imagine this scene as an abstract work of art, where geometric shapes and cosmological concepts merge

In Fig.1 and Fig.2 let's imagine a regular octahedron representing the universe in its phase of high symmetry and very low entropy. Inside the octahedron we have an inscribed sphere that emerges from perturbations of the quantum vacuum during eternal inflation. As time passes, the universe expands, the faces of the octahedron break (symmetry breaks), and entropy increases. Spheres emerge from the octahedra, symbolizing the transition phases from a regime of very low entropy to a universe in which, with the passage of time, entropy increases, increasing the complexity of the universe itself.

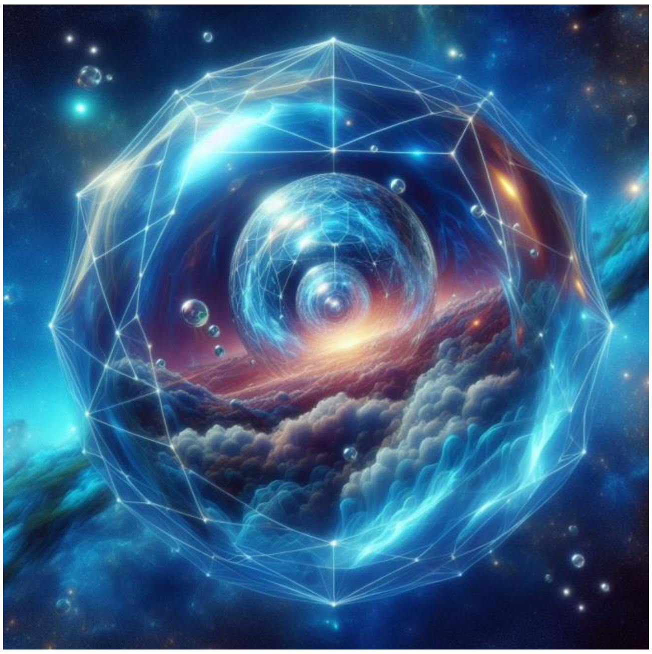

Fig. 1

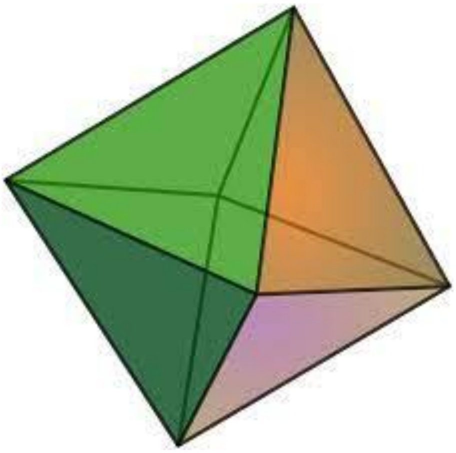
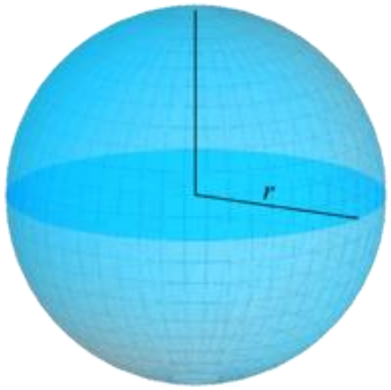
Fig. 2

Now, we have that:



Octahedron



Sphere

From the octahedron volume V = $1/3*\sqrt{2}\ l^3$ and, from the sphere volume,

V = $(4/3*\pi*r^3)$, we consider the following relationship, for r = x:

4/3*π*x^3 = 1/3*√2*l^3

Input

$$\frac{4}{3}\pi x^3 = \frac{1}{3}\sqrt{2}\, l^3$$

Exact result

$$\frac{4\pi x^3}{3} = \frac{\sqrt{2}\, l^3}{3}$$

Alternate forms

$$x^3 = \frac{l^3}{2\sqrt{2}\,\pi}$$

$$\frac{4\pi x^3}{3} - \frac{\sqrt{2}\, l^3}{3} = 0$$

Real solution

$$x = \frac{(-1)^{2/3}\, l}{\sqrt{2}\, \sqrt[3]{\pi}}$$

Solutions

$$x = -\frac{\sqrt[3]{-\frac{1}{\pi}}\, l}{\sqrt{2}}$$

,

$$x = \frac{l}{\sqrt{2}\, \sqrt[3]{\pi}}$$

,

$$x = \frac{(-1)^{2/3}\, l}{\sqrt{2}\, \sqrt[3]{\pi}}$$

Integer solution

$l = 0, \quad x = 0$

Implicit derivatives

$$\frac{\partial x(l)}{\partial l} = \frac{l^2}{2\sqrt{2}\,\pi x^2}$$

$$\frac{\partial l(x)}{\partial x} = \frac{2\sqrt{2}\,\pi x^2}{l^2}$$

From the alternate form

$$x^3 = \frac{l^3}{2\sqrt{2}\,\pi}$$

$$x = \frac{l}{\sqrt{2}\,\sqrt[3]{\pi}}$$

for l = 8, we have that:

8/(sqrt(2) π^(1/3)) = 8/(2sqrt2 * Pi)^1/3

Input

$$\frac{8}{\sqrt{2}\,\sqrt[3]{\pi}} = \frac{8}{\sqrt[3]{2\sqrt{2}\,\pi}}$$

Result

True

Logarithmic form

$$\log_{\sqrt{2}\,\sqrt[3]{\pi}}(8) - \log_{\sqrt{2}\,\sqrt[3]{\pi}}\left(\sqrt{2}\,\sqrt[3]{\pi}\right) = \log_{\sqrt{2}\,\sqrt[3]{\pi}}(8) - \log_{\sqrt{2}\,\sqrt[3]{\pi}}\left(\sqrt[3]{2\sqrt{2}\,\pi}\right)$$

$\log_b(x)$ is the base- b logarithm

Thence:

l/(sqrt(2) π^(1/3)) = l/(2sqrt2 * Pi)^1/3

Input

$$\frac{l}{\sqrt{2}\,\sqrt[3]{\pi}} = \frac{l}{\sqrt[3]{2\sqrt{2}\,\pi}}$$

Logarithmic form

$$\log_{\sqrt{2}\,\sqrt[3]{\pi}}(l) - \log_{\sqrt{2}\,\sqrt[3]{\pi}}\left(\sqrt{2}\,\sqrt[3]{\pi}\right) = \log_{\sqrt{2}\,\sqrt[3]{\pi}}(l) - \log_{\sqrt{2}\,\sqrt[3]{\pi}}\left(\sqrt[3]{2\sqrt{2}\,\pi}\right)$$

$\log_b(x)$ is the base- b logarithm

Now, we have that:

l/(2 sqrt(2) π)^(1/3) = (2sqrt2)/Pi

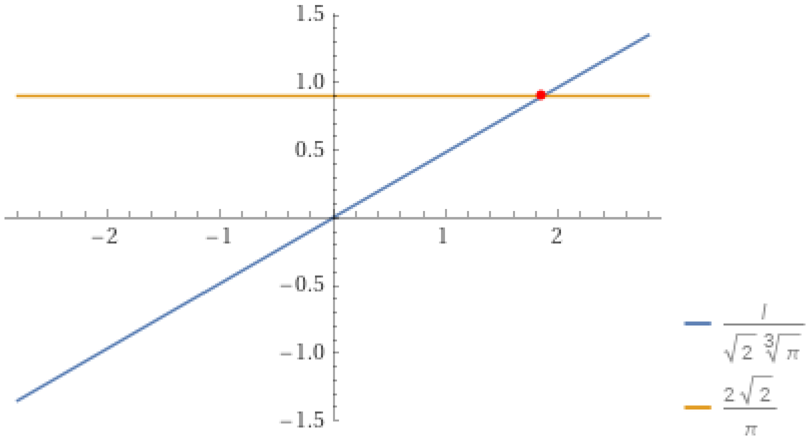
Input

$$\frac{l}{\sqrt[3]{2\sqrt{2}\,\pi}} = \frac{2\sqrt{2}}{\pi}$$

Exact result

$$\frac{l}{\sqrt{2}\,\sqrt[3]{\pi}} = \frac{2\sqrt{2}}{\pi}$$

Plot



Solution

$$l = \frac{4}{\pi^{2/3}}$$

$$l = \frac{4}{\sqrt[3]{\pi^2}}$$

From:

On certain arithmetical functions – *S. Ramanujan* - Transactions of the Cambridge Philosophical Society, XXII, No.9, 1916, 159 – 184

We analyze the following equations

$$Q^3 - R^2 = 1728x\{(1-x)(1-x^2)(1-x^3)\cdots\}^{24}.$$

We consider:

Q^3 = R^2 +(1728*x[(1-x)(1-x^2)(1-x^3)]^24)

Input

$$Q^3 = R^2 + 1728\,x\left((1-x)\left(1-x^2\right)\left(1-x^3\right)\right)^{24}$$

Integer solutions

$Q = 1\,,\quad R = \pm 1\,,\quad x = \pm 1$

$Q = 4\,,\quad R = \pm 8\,,\quad x = \pm 1$

$Q = 0\,,\quad R = 0\,,\quad x = \pm 1$

$Q = 1\,,\quad R = \pm 1\,,\quad x = 0$

$Q = 4\,,\quad R = \pm 8\,,\quad x = 0$

For Q = 4; $Q^3 = 64$:

R^2 + 1728 x ((1 - x) (1 - x^2) (1 - x^3))^24 = 64

Input

$$R^2 + 1728\,x\left((1-x)\left(1-x^2\right)\left(1-x^3\right)\right)^{24} = 64$$

Integer solutions

$R = \pm 8\,,\quad x = \pm 1$

$R = \pm 8\,,\quad x = 0$

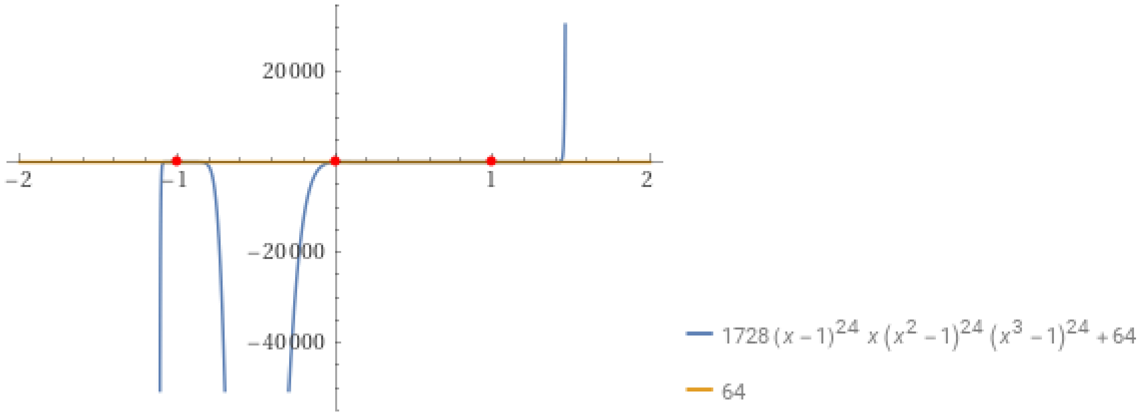
For R = 8:

8^2 + 1728 x ((1 - x) (1 - x^2) (1 - x^3))^24 = 64

Input

$$8^2 + 1728\,x\left((1-x)\left(1-x^2\right)\left(1-x^3\right)\right)^{24} = 64$$

Plot **(figures that can be related to the open strings)**



Alternate forms

$$1728\,x\,(x+1)^{24}\left(x^2+x+1\right)^{24}(x-1)^{72}+64=64$$

$$1728\,(x-1)^{24}\,x\left(x^2-1\right)^{24}\left(x^3-1\right)^{24}+64=64$$

$$

Real solutions

$x = -1$

$x = 0$

$x = 1$

Complex solutions

$$x = -\frac{1}{2} - \frac{i\sqrt{3}}{2}$$

$$x = -\frac{1}{2} + \frac{i\sqrt{3}}{2}$$

(Roots of imaginary unit)

From which, for x = the second root of imaginary unit:

8^2 + 1728 (-1/2 + (i sqrt(3))/2) ((1 - (-1/2 + (i sqrt(3))/2)) (1 - (-1/2 + (i sqrt(3))/2)^2) (1 - (-1/2 + (i sqrt(3))/2)^3))^24

Input

$$8^2 + 1728\left(-\frac{1}{2} + \frac{1}{2}\left(i\sqrt{3}\right)\right) \left(\left(1 - \left(-\frac{1}{2} + \frac{1}{2}\left(i\sqrt{3}\right)\right)\right)\left(1 - \left(-\frac{1}{2} + \frac{1}{2}\left(i\sqrt{3}\right)\right)^2\right)\left(1 - \left(-\frac{1}{2} + \frac{1}{2}\left(i\sqrt{3}\right)\right)^3\right)\right)^{24}$$

i is the imaginary unit

Result

64

$64 = 8^2$

And:

(8^2 + 1728 (-1/2 + (i sqrt(3))/2) ((1 - (-1/2 + (i sqrt(3))/2)) (1 - (-1/2 + (i sqrt(3))/2)^2) (1 - (-1/2 + (i sqrt(3))/2)^3))^24)^2

Input

$$\left(8^2 + 1728\left(-\frac{1}{2}+\frac{1}{2}\left(i\sqrt{3}\right)\right)\left(\left(1-\left(-\frac{1}{2}+\frac{1}{2}\left(i\sqrt{3}\right)\right)\right)\left(1-\left(-\frac{1}{2}+\frac{1}{2}\left(i\sqrt{3}\right)\right)^2\right)\left(1-\left(-\frac{1}{2}+\frac{1}{2}\left(i\sqrt{3}\right)\right)^3\right)\right)^{24}\right)^2$$

i is the imaginary unit

Result

4096

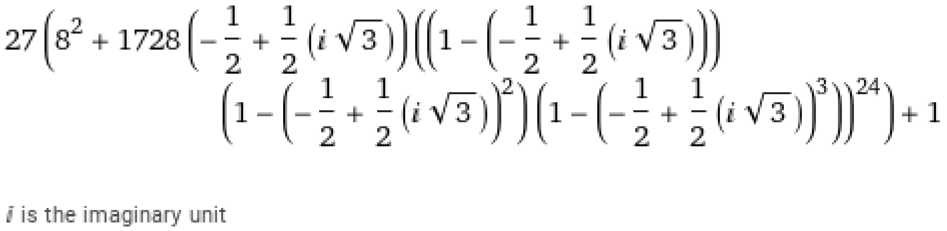
4096

The number 4096 = 64^2, is the Ramanujan Recurring Number, that when multiplied by 2 give 8192. The total amplitude vanishes for gauge group SO(8192) for bosonic string SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). This could be the implications for a pre-big bang scenario where only self-perturbative bosonic strings lived when the enthalpy was extremely low as discussed above. This regime contains all the intrinsic properties of superstrings inherent in the bosonic strings, would at the big bang give effect to the properties of matter (fermions) as Higgs Boson. This number theoretic connection to the gauge group SO(8192), gives a much more compelling relevance of the bosonic string theory SO(8192), to quantum gravity and places this string theory where it should appropriately be in the evolution of the universe from a quantum gravity perspective rather than it be neglected because it doesn't include fermionic strings to confirm to post big-bang reality. The vanishing of the bosonic string's amplitude could be explained by the effect of extreme low entropy on the quantum vacuum geometry. Thus, as the entropy increases infinitesimally as a result of the vacuum self-perturbation then also is the amplitude of the vibrating bosonic strings from zero.

Thus, was right to indicate that the “vanishing of the amplitude of the bosonic string could be the results of string theory itself”, but here, we give a much more elaborate explanation of what could be happening.

27*(((8^2 + 1728 (-1/2 + (i sqrt(3))/2) ((1 - (-1/2 + (i sqrt(3))/2)) (1 - (-1/2 + (i sqrt(3))/2)^2) (1 - (-1/2 + (i sqrt(3))/2)^3))^24)))+1

Input



$$27\left(8^2+1728\left(-\frac{1}{2}+\frac{1}{2}\left(i\sqrt{3}\right)\right)\left(\left(1-\left(-\frac{1}{2}+\frac{1}{2}\left(i\sqrt{3}\right)\right)\right)\left(1-\left(-\frac{1}{2}+\frac{1}{2}\left(i\sqrt{3}\right)\right)^2\right)\left(1-\left(-\frac{1}{2}+\frac{1}{2}\left(i\sqrt{3}\right)\right)^3\right)\right)^{24}\right)+1$$

i is the imaginary unit

Result

1729

1729

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve $1728 = 8^2 \times 3^3$. The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways $10^3 + 9^3 = 12^3 + 1^3 = 1729$ and Ramanujan's recurring number). Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string. Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron.

As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string. That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2. Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after? That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

(27*(((8^2 + 1728 (-1/2 + (i sqrt(3))/2) ((1 - (-1/2 + (i sqrt(3))/2)) (1 - (-1/2 + (i sqrt(3))/2)^2) (1 - (-1/2 + (i sqrt(3))/2)^3))^24)))+1)^1/15+(MRB const)^(1-1/(4π)+π)

…

4095.9741321…. ≈ 4096

The number 4096 = 64^2, is the Ramanujan Recurring Number, that when multiplied by 2 give 8192. The total amplitude vanishes for gauge group SO(8192) for bosonic string SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). This could be the implications for a pre-big bang scenario where only self-perturbative bosonic strings lived when the enthalpy was extremely low as discussed above. This regime contains all the intrinsic properties of superstrings inherent in the bosonic strings, would at the big bang give effect to the properties of matter (fermions) as Higgs Boson. This number theoretic connection to the gauge group SO(8192), gives a much more compelling relevance of the bosonic string theory SO(8192), to quantum gravity and places this string theory where it should appropriately be in the evolution of the universe from a quantum gravity perspective rather than it be neglected because it doesn't include fermionic strings to confirm to post big-bang reality. The vanishing of the bosonic string's amplitude could be explained by the effect of extreme low entropy on the quantum vacuum geometry. Thus, as the entropy increases infinitesimally as a result of the vacuum self-perturbation then also is the amplitude of the vibrating bosonic strings from zero. Thus, was right to indicate that the "vanishing of the amplitude of the bosonic string could be the results of string theory itself", but here, we give a much more elaborate explanation of what could be happening.

27*sqrt((1/2(2ln(41472 (1 – 3*2 + 5 2^3 - 7 2^6)^6 (-2 + 27 2 + 20 2^2 - 280 2^3 + 527 2^5 + 896 2^6 - 3570 2^8 + 4802 2^11))+5/2))^2-Pi-sqrt2)+1

Input

$$27\sqrt{\left(\left(\frac{1}{2}\left(2\log\left(41\,472\left(1-3\times 2+5\times 2^{3}-7\times 2^{6}\right)^{6}\left(-2+27\times 2+20\times 2^{2}-280\times 2^{3}+527\times 2^{5}+896\times 2^{6}-3570\times 2^{8}+4802\times 2^{11}\right)\right)+\frac{5}{2}\right)\right)^{2}-\pi-\sqrt{2}\right)}+1$$

log(x) is the natural logarithm

Exact result

$$1+27\sqrt{-\sqrt{2}-\pi+\frac{1}{4}\left(\frac{5}{2}+2\log(1\,850\,734\,991\,447\,541\,707\,336\,091\,648)\right)^{2}}$$

1728.9945434829756688202039128492803952371452802476722936540063211
...

1728.99454348….

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve $1728 = 8^2 \times 3^3$. The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways $10^3 + 9^3 = 12^3 + 1^3 = 1729$ and Ramanujan's recurring number). Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string. Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron.

As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string. That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2. Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after? That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

4095.998860819617787997123418104787825304120239056255858020064009…

4095.998860819…. ≈ 4096

The number 4096 = 64^2, is the Ramanujan Recurring Number, that when multiplied by 2 give 8192. The total amplitude vanishes for gauge group SO(8192) for bosonic string SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). This could be the implications for a pre-big bang scenario where only self-perturbative bosonic strings lived when the enthalpy was extremely low as discussed above. This regime contains all the intrinsic properties of superstrings inherent in the bosonic strings, would at the big bang give effect to the properties of matter (fermions) as Higgs Boson. This number theoretic connection to the gauge group SO(8192), gives a much more compelling relevance of the bosonic string theory SO(8192), to quantum gravity and places this string theory where it should appropriately be in the evolution of the universe from a quantum gravity perspective rather than it be neglected because it doesn't include fermionic strings to confirm to post big-bang reality.

The vanishing of the bosonic string's amplitude could be explained by the effect of extreme low entropy on the quantum vacuum geometry. Thus, as the entropy increases infinitesimally as a result of the vacuum self-perturbation then also is the amplitude of the vibrating bosonic strings from zero. Thus, was right to indicate that the "vanishing of the amplitude of the bosonic string could be the results of string theory itself", but here, we give a much more elaborate explanation of what could be happening.

…

1728.9997597….

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve $1728 = 8^2 \times 3^3$. The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways $10^3 + 9^3 = 12^3 + 1^3 = 1729$ and Ramanujan's recurring number). Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string. Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron. As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string. That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2. Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after? That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

…

4096.00079712621…. ≈ 4096

The number 4096 = 64^2, is the Ramanujan Recurring Number, that when multiplied by 2 give 8192. The total amplitude vanishes for gauge group SO(8192) for bosonic string SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). This could be the implications for a pre-big bang scenario where only self-perturbative bosonic strings lived when the enthalpy was extremely low as discussed above. This regime contains all the intrinsic properties of superstrings inherent in the bosonic strings, would at the big bang give effect to the properties of matter (fermions) as Higgs Boson. This number theoretic connection to the gauge group SO(8192), gives a much more compelling relevance of the bosonic string theory SO(8192), to quantum gravity and places this string theory where it should appropriately be in the evolution of the universe from a quantum gravity perspective rather than it be neglected because it doesn't include fermionic strings to confirm to post big-bang reality. The vanishing of the bosonic string's amplitude could be explained by the effect of extreme low entropy on the quantum vacuum geometry. Thus, as the entropy increases infinitesimally as a result of the vacuum self-perturbation then also is the amplitude of the vibrating bosonic strings from zero. Thus, was right to indicate that the "vanishing of the amplitude of the bosonic string could be the results of string theory itself", but here, we give a much more elaborate explanation of what could be happening.

Property

…

1729.0001681438….

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve $1728 = 8^2 \times 3^3$. The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways $10^3 + 9^3 = 12^3 + 1^3 = 1729$ and Ramanujan's recurring number). Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string. Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron. As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string. That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2. Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after? That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

Property

$1 + \frac{249141067495538427}{1480137458881\,\pi^4}$ is a transcendental number

Alternate form

$\mathbb{R}$ is the set of real numbers

On the application of the formulas of the volumes of an octahedron and a sphere

With regard to a sphere inscribed in an octahedron, we have the following formulas.

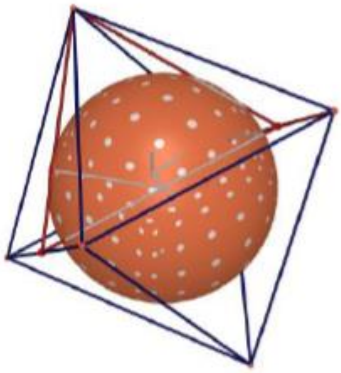

Fig: sphere inscribed in an octahedron

$V_0 = \frac{1}{3}\sqrt{2}\, l^3$

$V_s = \frac{4}{3}\pi r^3$; where $r_s = (l/2)$

With regard the ratio between the two above formulas (octahedron and sphere)

(1/3*√2*l^3)/(4/3*π*(l/2)^3)

we obtain:

Input

$$\frac{\frac{1}{3}\sqrt{2}\, l^3}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^3}$$

Result

$\frac{\sqrt{2}\ 2}{\pi}$ (for $l \neq 0$)

Decimal approximation

$$6\pi\sqrt{2}\times\frac{\frac{1}{3}\sqrt{2}\,l^3}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^3}$$

Exact result

24

24

The value 24 is linked to the "Ramanujan function" (an elliptic modular function that satisfies the need for "conformal symmetry") that has 24 "modes" corresponding to the physical vibrations of a bosonic string representing a bosons. From the analysis, we observe that the is no number theoretic connection with physical vibrations of fermionic strings at extremally low entropy. This fact is confirmed by the fact that the Higgs bosons at the moment of the big bang and infinitesimally shortly thereafter, facilitated the creation of fermions (matter and antimatter particles) [8]. Thus we note that the ingredients for the formation of electromagnetic radiation from photons (a Boson), and the formation of matter from the Higgs boson after the big bang, are intrinsic properties of the vacuum energy in pre-big bang.

Series representations

$$\frac{\left(6\pi\sqrt{2}\right)\left(\sqrt{2}\,l^3\right)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3}=12\sqrt{z_0}^{\,2}\left(\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(2-z_0)^k\,z_0^{-k}}{k!}\right)^2$$

for (not ($z_0\in\mathbb{R}$ and $-\infty<z_0\leq 0$))

$$\frac{(6\pi\sqrt{2})(\sqrt{2}\,l^3)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3} = 12\exp^2\left(i\pi\left\lfloor\frac{\arg(2-x)}{2\pi}\right\rfloor\right)\sqrt{x}^2\left(\sum_{k=0}^{\infty}\frac{(-1)^k(2-x)^k x^{-k}\left(-\frac{1}{2}\right)_k}{k!}\right)^2$$

for ($x \in \mathbb{R}$ and $x < 0$)

$$\frac{(6\pi\sqrt{2})(\sqrt{2}\,l^3)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3} =$$

$$12\left(\frac{1}{z_0}\right)^{\lfloor\arg(2-z_0)/(2\pi)\rfloor} z_0^{1+\lfloor\arg(2-z_0)/(2\pi)\rfloor}\left(\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(2-z_0)^k z_0^{-k}}{k!}\right)^2$$

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x\rfloor$ is the floor function

i is the imaginary unit

This could imply that all matter (fermions) was preceded by bosons. That is, before the Big Bang, from perturbations of the vacuum energy itself, bosons were created, and successively at the Big Bang, and infinitesimally shortly after the Big Bang, fermions, were created from the vacuum energy that underwent a violent “breaking” that formed a hot plasma. of particle-antiparticle pairs. This therefore implies that quantum gravity was not necessarily “dark” to some extent, because a photon (light particle) is itself a boson. Therefore, a big bang was not necessarily the moment of the creation of light, but of the creation of matter (fermions) from vacuum energy, as this undergoes further "breaking" in the cosmological constant, in the hot plasma of matter and in the energy dark.

(2π*√2((1/3*√2*l^3)/(4/3*π*(l/2)^3)))^4

Input

$$\left(2\pi\sqrt{2}\times\frac{\frac{1}{3}\sqrt{2}\,l^3}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^3}\right)^4$$

Exact result

4096

$4096 = 64^2$, (Ramanujan Recurring Number) that multiplied by 2 give 8192, indeed:

The total amplitude vanishes for gauge group SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). (From: "Dilaton Tadpole for the Open Bosonic String " Michael R. Douglas and Benjamin Grinstein - September 2,1986)

$\Gamma(x)$ is the gamma function

$\operatorname{Re}(z)$ is the real part of z

$|z|$ is the absolute value of z

Furthermore, from the formula

$$2^{-1/\pi}\,\sqrt[2\pi]{5\left(3+\sqrt{5}\right)\pi}$$

we obtain also:

(4 (1.6180085459)^(2 π))/(5 (3 + sqrt(5))) = 3.1415926535

Indeed:

$$\frac{4 \times 1.6180085459^{2\pi}}{5\left(3+\sqrt{5}\right)}$$

3.1415926535884871624221932509858715278931025189245576170078100613
…

3.1415926535…. = π (Ramanujan Recurring Number)

From the following extended DN Constant (“Unitary Formula”)

$$\sqrt[2\pi]{\frac{\frac{5}{12}(3+\sqrt{5})d^3}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3} \times \frac{1}{\frac{\frac{1}{3}\sqrt{2}a^3}{\frac{4}{3}\pi\left(\frac{a}{2}\right)^3}} \times \frac{1}{\frac{\sqrt{2}}{12}d^3 \cdot \frac{1}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}}} \times \sqrt[3]{-\frac{q}{2}+\sqrt{\frac{q^2}{4}+\frac{p^3}{27}}} + \sqrt[3]{-\frac{q}{2}-\sqrt{\frac{q^2}{4}+\frac{p^3}{27}}}$$

with regard

$$\sqrt[3]{-\frac{q}{2}+\sqrt{\frac{q^2}{4}+\frac{p^3}{27}}} + \sqrt[3]{-\frac{q}{2}-\sqrt{\frac{q^2}{4}+\frac{p^3}{27}}}$$

for q = 1729 and p = 4096, we obtain by changing the sign in the algebraic sum of the aforementioned Cardano’s Formula and after some calculations:

$$2^{-1/\pi}\sqrt[2\pi]{5\left(3+\sqrt{5}\right)\pi}$$

multiplied by

$$\sqrt[9]{\sqrt[3]{-\frac{1729}{2}+\sqrt{\frac{1729^2}{4}+\frac{4096^3}{27}}} - \sqrt[3]{-\frac{1729}{2}-\sqrt{\frac{1729^2}{4}+\frac{4096^3}{27}}}}$$

and performing the ninth root of the entire expression:

√((2^(-1/π)(5(3+√(5))π)^(1/(2π)))((∛(-1729/2+√(1729^2/4+4096^3/27)) -∛(-1729/2-√(1729^2/4+4096^3/27)))^1/9))

we obtain:

$$\sqrt{\left(\left(2^{-1/\pi}\sqrt[2\pi]{5\left(3+\sqrt{5}\right)\pi}\right)\sqrt[9]{\sqrt[3]{-\frac{1729}{2}+\sqrt{\frac{1729^2}{4}+\frac{4096^3}{27}}}-\sqrt[3]{-\frac{1729}{2}-\sqrt{\frac{1729^2}{4}+\frac{4096^3}{27}}}}\right)}$$

$$2^{-1/(2\pi)}\sqrt[18]{\sqrt[3]{\frac{\sqrt{\frac{274958621851}{3}}}{6}-\frac{1729}{2}}+\sqrt[3]{\frac{1729}{2}+\frac{\sqrt{\frac{274958621851}{3}}}{6}}}\sqrt[4\pi]{5\left(3+\sqrt{5}\right)\pi}$$

i.e.

2^(-1/(2π)) ((-1729/2+√(274958621851/3)/6)^(1/3)+(1729/2 + √(274958621851/3)/6)^(1/3))^(1/18) (5(3+√(5)) π)^(1/(4π))

= 1.61549140391….

The general "unitary" formula, which derives from DN Constant, is the following:

$$\sqrt{2\times\frac{2\cdot\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{1}{\pi\cdot 0.9991104684}\left(C\times \mathrm{R}\times 2.33\cdot 10^{-13}\right)}}\cong 1.61803398\ldots=\frac{\sqrt{5}+1}{2}$$

Where $\frac{2\sqrt{2}}{\pi}$ is the Del Gaudio-Nardelli Constant, 0.9991104684 is the value of the following Rogers-Ramanujan continued fraction:

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\frac{e^{-\pi\sqrt{5}}}{1+\frac{e^{-2\pi\sqrt{5}}}{1+\frac{e^{-3\pi\sqrt{5}}}{1+\frac{e^{-4\pi\sqrt{5}}}{1+\ldots}}}}\approx 0.9991104684$$

C is any constant or solution to an equation, R is the radius of the Universe and $2.33*10^{-13}$ is the temperature of the universe expressed in GeV.

For example, C = 9.9128 , inserting a radius of the Universe, which we have calculated, equal to R = $2.06274*10^{12}$ years, from DN Constant "unitary" formula, we obtain:

√(2×(2·(((2√2)/π))^(1/16))/(1/(π·0.9991104684) (9.9128×(2.06274 × 10^12)×2.33·10^(-13))))

$$\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{1}{\pi\times 0.9991104684}\times\frac{9.9128\times 2.06274\times 10^{12}\times 2.33}{10^{13}}}}$$

1.6180359123482642354401744088347098542545273508401733563064818107
...

1.618035912348…. result that is a very good approximation to the value of the golden ratio 1.618033988749… (Ramanujan Recurring Number)

We obtain also:

(√(2×(2·(((2√2)/π))^(1/16))/(1/(π·0.9991104684) (9.9128×(2.06274 × 10^12)×2.33·10^(-13)))))dxdydz

Indefinite integral assuming all variables are real

$0.809018\, x^2\, y\, z + \text{constant}$

Definite integral over a cube of edge length 2 L

$$\int_{-L}^{L}\int_{-L}^{L}\int_{-L}^{L} 1.61804\, dx\, dy\, dz = 12.9443\, L^3$$

Definite integral over a sphere of radius R

$$\iiint\limits_{x^2+y^2+z^2<R^2} 1.61804\, dz\, dy\, dx = 6.77761\, R^3$$

From which, for L = R = 1 , dividing the two definite integral results by the original expression, we obtain:

12.9443/(√(2×(2·(((2√2)/π))^(1/16))/(1/(π·0.9991104684) (9.9128×(2.06274 × 10^12)×2.33·10^(-13)))))

Input interpretation

$$\frac{12.9443}{\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{1}{\pi\times 0.9991104684}\times\frac{9.9128\times 2.06274\times 10^{12}\times 2.33}{10^{13}}}}}$$

12.5664…. ≈ 4π = Bekenstein-Hawking (S_{BH}) black hole entropy

New fundamental formula deriving from DN Constant

The DN Constant (Del Gaudio-Nardelli Constant) equals (2√2)/π) is defined as the ratio of the volume of an octahedron to the volume of a sphere and is an intriguing mathematical concept. Michele Nardelli hypothesized that the regular octahedron represents a phase in which the universe is highly symmetrical and with very low entropy. On the other hand, the sphere (which is inscribed in the octahedron, i.e. is "inside" it) represents the universe emerging from the quantum vacuum, which over time increases entropy and undergoes various symmetry breakings. This occurs in a regime of eternal inflation.

From the following expression

√(2×(2·(((2√2)/π)^(1/16)))/(4096/(π·0.9991104684) (((1.616255*10^-35)/(1.1056*10^-52))×C×R)))

$$\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{4096}{\pi\times0.9991104684}\left(\frac{1.616255\times10^{-35}}{1.1056\times10^{-52}}\,C\,R\right)}}$$

which comes from the DN Constant, with 1.616255*10^{-35} which is equal to the Planck length, 1.1056*10^{-52} which is equal to the Cosmological Constant, C = 1729 which corresponds to the Hardy-Ramanujan number and R = 4.6018401361 × 10^{-24}, which represents the radius of the Universe, we obtain:

√(2×(2·(((2√2)/π)^(1/16)))/(4096/(π·0.9991104684) (((1.616255*10^-35)/(1.1056*10^-52))×1729×4.6018401361 × 10^-24))) = 1.6180329973...

$$\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{4096}{\pi\times0.9991104684}\left(\frac{1.616255\times10^{-35}}{1.1056\times10^{-52}}\times1729\times4.6018401361\times10^{-24}\right)}}$$

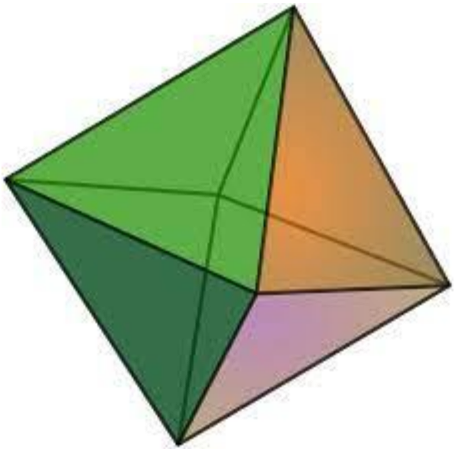
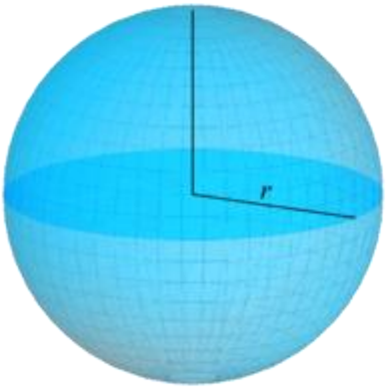
Now, we have that:



Octahedron



Sphere

Given the value of a volume, independently of the solid, following the Poincaré Conjecture, we compare any solid "without holes" and a sphere. If we compare an octahedron with a sphere, we have:

$$\frac{4}{3}\pi r^3 = \frac{1}{3}\sqrt{2}a^3$$

If we consider the radius of the sphere as an unknown, we must find the value of the side of the octahedron which allows us to equalize the two volumes and which will give us the DN Constant as a result (which will therefore be equal to the radius of the sphere).

From

$$\frac{4}{3}\pi r^3 = \frac{1}{3}\sqrt{2}a^3$$

To find r we perform the following calculation:

$$r^3 = \frac{\frac{1}{3}\sqrt{2}a^3}{\frac{4}{3}\pi} = \frac{1}{3}\sqrt{2}a^3 \cdot \frac{3}{4\pi} = \frac{\sqrt{2}a^3}{4\pi} = \frac{\sqrt{2}\cdot\sqrt{2}a^3}{\sqrt{2}\cdot 4\pi} = \frac{2a^3}{\sqrt{2}\cdot 4\pi} = \frac{a^3}{2\sqrt{2}\pi}$$

$$r^3 = \frac{a^3}{2\sqrt{2}\pi}; \qquad r = \sqrt[3]{\frac{a^3}{2\sqrt{2}\pi}} = \frac{a}{\sqrt[3]{2\sqrt{2}\pi}}$$

To find a, we have, for

$$r = \frac{2\sqrt{2}}{\pi}; \qquad \frac{a}{\sqrt[3]{2\sqrt{2}\pi}} = \frac{2\sqrt{2}}{\pi};$$

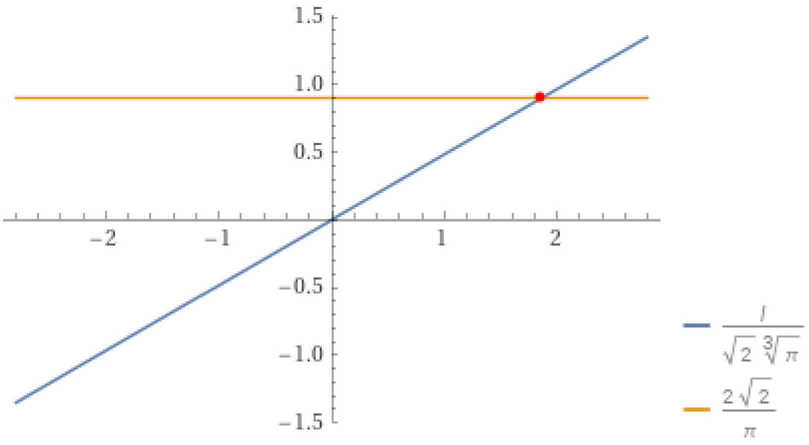
Thus, multiplying both the sides by $\sqrt[3]{2\sqrt{2}\pi}$, we obtain:

$$a = \frac{2\sqrt{2}}{\pi}\cdot\sqrt[3]{2\sqrt{2}\pi} = \sqrt[3]{\frac{\left(2\sqrt{2}\right)^3 2\sqrt{2}\pi}{\pi^3}} =$$

$$= \sqrt[3]{\frac{8\cdot\sqrt{2^3}\cdot 2\sqrt{2}}{\pi^2}} = \sqrt[3]{\frac{8\cdot\sqrt{2\cdot 2^2}\cdot 2\sqrt{2}}{\pi^2}} = \sqrt[3]{\frac{16\cdot\sqrt{2}\cdot 2\sqrt{2}}{\pi^2}}$$

$$= \sqrt[3]{\frac{32\,\sqrt{2}\sqrt{2}}{\pi^2}} = \sqrt[3]{\frac{32\ \cdot 2}{\pi^2}} = \frac{\sqrt[3]{64}}{\sqrt[3]{\pi^2}} = \frac{4}{\sqrt[3]{\pi^2}};\ a = \frac{4}{\sqrt[3]{\pi^2}}$$

Plot



Solution

$a = \frac{4}{\sqrt[3]{\pi^2}}$

for V = 1/3*√2*a^3 (octahedron volume) and V = (4/3*π*r^3) (sphere volume), we obtain:

from the octahedron volume, we have: V = 1/3*√2*a^3 = (1/3*√2*($\frac{4}{\sqrt[3]{\pi^2}}$)^3)

(1/3*√2*(4/∛(π^2))^3)

Input

$$\frac{1}{3}\sqrt{2}\left(\frac{4}{\sqrt[3]{\pi^2}}\right)^3$$

$\sqrt[3]{x}$ is the real-valued 3rd root of x

Exact result

$$\frac{64\sqrt{2}}{3\pi^2}$$

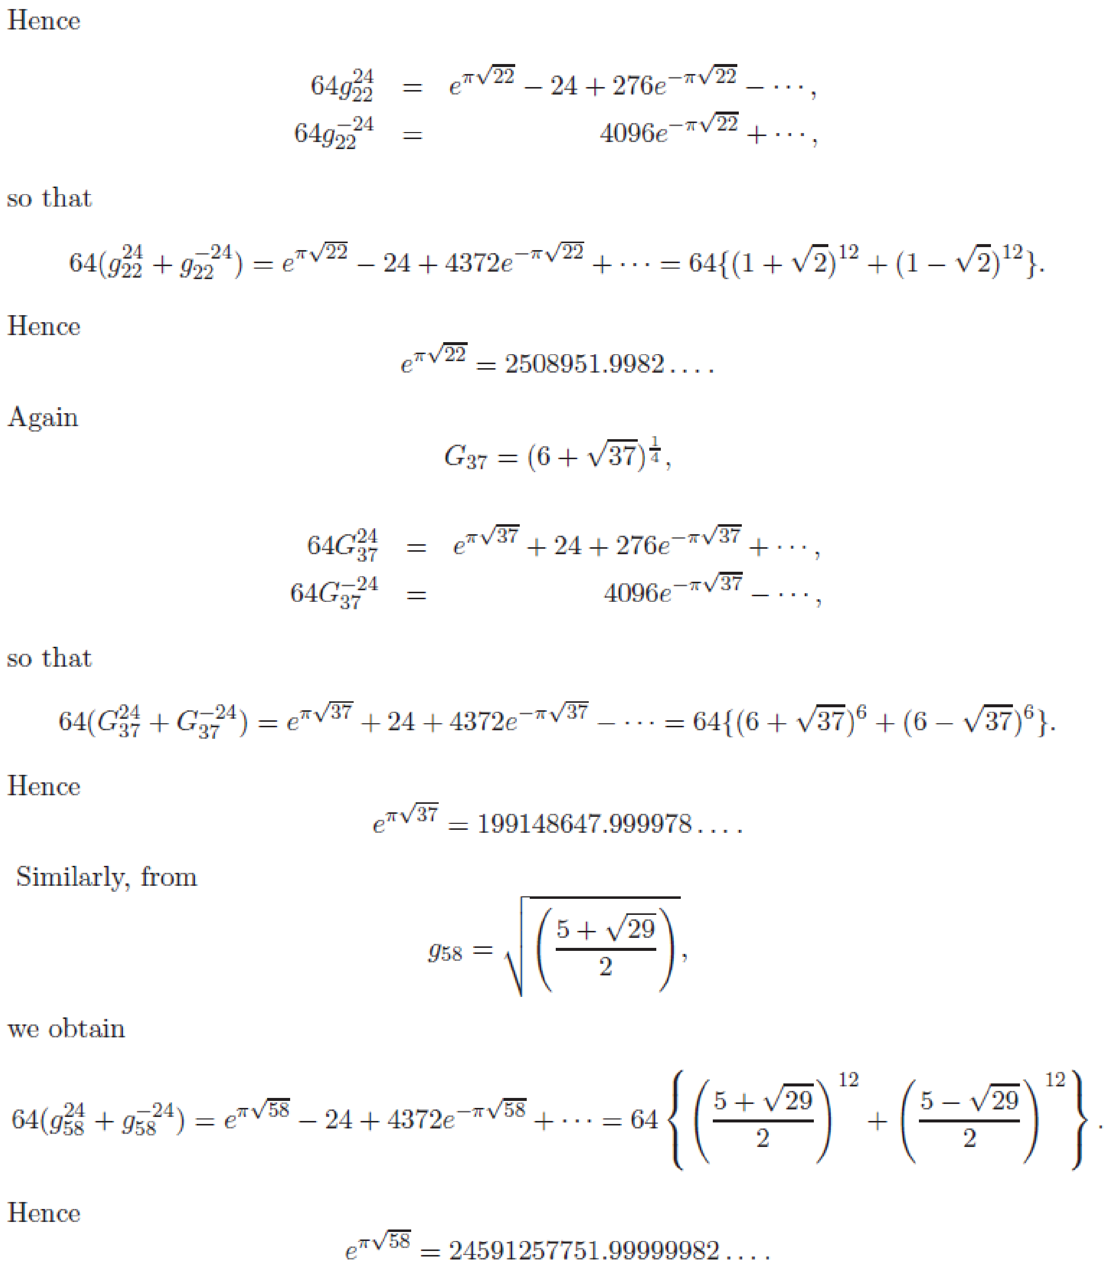
From:

Modular equations and approximations to π - *Srinivasa Ramanujan* - Quarterly Journal of Mathematics, XLV, 1914, 350 – 372

We have that:



Hence

$$\begin{aligned} 64g_{22}^{24} &= e^{\pi\sqrt{22}} - 24 + 276e^{-\pi\sqrt{22}} - \cdots, \\ 64g_{22}^{-24} &= 4096e^{-\pi\sqrt{22}} + \cdots, \end{aligned}$$

so that

$$64(g_{22}^{24} + g_{22}^{-24}) = e^{\pi\sqrt{22}} - 24 + 4372e^{-\pi\sqrt{22}} + \cdots = 64\{(1+\sqrt{2})^{12} + (1-\sqrt{2})^{12}\}.$$

Hence

$$e^{\pi\sqrt{22}} = 2508951.9982\ldots.$$

Again

$$G_{37} = (6+\sqrt{37})^{\frac{1}{4}},$$

$$\begin{aligned} 64G_{37}^{24} &= e^{\pi\sqrt{37}} + 24 + 276e^{-\pi\sqrt{37}} + \cdots, \\ 64G_{37}^{-24} &= 4096e^{-\pi\sqrt{37}} - \cdots, \end{aligned}$$

so that

$$64(G_{37}^{24} + G_{37}^{-24}) = e^{\pi\sqrt{37}} + 24 + 4372e^{-\pi\sqrt{37}} - \cdots = 64\{(6+\sqrt{37})^{6} + (6-\sqrt{37})^{6}\}.$$

Hence

$$e^{\pi\sqrt{37}} = 199148647.999978\ldots.$$

Similarly, from

$$g_{58} = \sqrt{\left(\frac{5+\sqrt{29}}{2}\right)},$$

we obtain

$$64(g_{58}^{24} + g_{58}^{-24}) = e^{\pi\sqrt{58}} - 24 + 4372e^{-\pi\sqrt{58}} + \cdots = 64\left\{\left(\frac{5+\sqrt{29}}{2}\right)^{12} + \left(\frac{5-\sqrt{29}}{2}\right)^{12}\right\}.$$

Hence

$$e^{\pi\sqrt{58}} = 24591257751.99999982\ldots.$$

We note that, with regard 4372, we can to obtain the following results:

27((4372)^1/2-2-1/2(((√(10-2√5) -2))⁄((√5-1))))+φ

Input

$$27\left(\sqrt{4372}-2-\frac{1}{2}\times\frac{\sqrt{10-2\sqrt{5}}-2}{\sqrt{5}-1}\right)+\phi$$

ϕ is the golden ratio

Result

$$\phi+27\left(-2+2\sqrt{1093}-\frac{\sqrt{10-2\sqrt{5}}-2}{2\left(\sqrt{5}-1\right)}\right)$$

Decimal approximation

for (not ($z_0 \in \mathbb{R}$ and $-\infty < z_0 \leq 0$))

Integral representation

$$(1+z)^a=\frac{\int_{-i\,\infty+\gamma}^{i\,\infty+\gamma}\frac{\Gamma(s)\,\Gamma(-a-s)}{z^s}\,ds}{(2\pi\,i)\,\Gamma(-a)}$$ for ($0<\gamma<-\mathrm{Re}(a)$ and $|\arg(z)|<\pi$)

From:

An Update on Brane Supersymmetry Breaking - *J. Mourad and A. Sagnotti* - arXiv:1711.11494v1 [hep-th] 30 Nov 2017

From the following vacuum equations:

$$T\, e^{\gamma_E\, \phi} \;=\; -\,\frac{\beta_E^{(p)}\, h^2}{\gamma_E}\; e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}$$

$$16\, k'\, e^{-2C} \;=\; \frac{h^2\left(p\,+\,1\,-\,\frac{2\,\beta_E^{(p)}}{\gamma_E}\right) e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}}{(7\,-\,p)}$$

$$(A')^2 \;=\; k\, e^{-2\,A} \;+\; \frac{h^2}{16(p\,+\,1)}\left(7\,-\,p\,+\,\frac{2\,\beta_E^{(p)}}{\gamma_E}\right) e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}$$

we have obtained, from the results almost equals of the equations, putting

$4096\, e^{-\pi\sqrt{18}}$ instead of

$$e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}$$

a new possible mathematical connection between the two exponentials. Thence, also the values concerning p, C, β_E and ϕ correspond to the exponents of e (i.e. of exp). Thence we obtain for p = 5 and $\beta_E = 1/2$:

$$e^{-6C+\phi} = 4096e^{-\pi\sqrt{18}}$$

Therefore, with respect to the exponentials of the vacuum equations, the Ramanujan's exponential has a coefficient of 4096 which is equal to 64^2, while $-6C+\phi$ is equal to $-\pi\sqrt{18}$. From this it follows that it is possible to establish mathematically, the dilaton value.

For

exp((-Pi*sqrt(18)) we obtain:

Input:

$$\exp\left(-\pi\sqrt{18}\right)$$

Exact result:

$$e^{-3\sqrt{2}\pi}$$

Decimal approximation:

$$1.627201622607250929294215673911797954183858113695401 6\ldots \times 10^{-6}$$

$1.6272016\ldots * 10^{-6}$

Property:

$e^{-3\sqrt{2}\pi}$ is a transcendental number

Series representations:

$$e^{-\pi\sqrt{18}} = e^{-\pi\sqrt{17}\sum_{k=0}^{\infty} 17^{-k}\binom{1/2}{k}}$$

$$e^{-\pi\sqrt{18}} = \exp\left(-\pi\sqrt{17}\sum_{k=0}^{\infty}\frac{\left(-\frac{1}{17}\right)^k\left(-\frac{1}{2}\right)_k}{k!}\right)$$

$$e^{-\pi\sqrt{18}} = \exp\left(-\frac{\pi \sum_{j=0}^{\infty} \operatorname{Res}_{s=-\frac{1}{2}+j} 17^{-s}\, \Gamma\left(-\frac{1}{2}-s\right) \Gamma(s)}{2\sqrt{\pi}}\right)$$

Now, we have the following calculations:

$$e^{-6C+\phi} = 4096 e^{-\pi\sqrt{18}}$$

$$e^{-\pi\sqrt{18}} = 1.6272016\ldots * 10^{-6}$$

from which:

$$\frac{1}{4096} e^{-6C+\phi} = 1.6272016\ldots * 10^{-6}$$

$$0.000244140625\, e^{-6C+\phi} = e^{-\pi\sqrt{18}} = 1.6272016\ldots * 10^{-6}$$

Now:

$$\ln\left(e^{-\pi\sqrt{18}}\right) = -13.328648814475 = -\pi\sqrt{18}$$

And:

(1.6272016* 10^-6) *1/ (0.000244140625)

Input interpretation:

$$\frac{1.6272016}{10^6} \times \frac{1}{0.000244140625}$$

Result:

0.0066650177536

0.006665017...

Thence:

$$0.000244140625\, e^{-6C+\phi} = e^{-\pi\sqrt{18}}$$

Dividing both sides by 0.000244140625, we obtain:

$$\frac{0.000244140625}{0.000244140625} e^{-6C+\phi} = \frac{1}{0.000244140625} e^{-\pi\sqrt{18}}$$

$$e^{-6C+\phi} = 0.0066650177536$$

((((exp((-Pi*sqrt(18)))))))*1/0.000244140625

Input interpretation:

$$\exp\left(-\pi \sqrt{18}\right) \times \frac{1}{0.000244140625}$$

Result:

0.00666501785...

0.00666501785…

Series representations:

$$\frac{\exp(-\pi\sqrt{18})}{0.000244141} = 4096\exp\left(-\pi\sqrt{17}\sum_{k=0}^{\infty}17^{-k}\binom{\frac{1}{2}}{k}\right)$$

$$\frac{\exp(-\pi\sqrt{18})}{0.000244141} = 4096\exp\left(-\pi\sqrt{17}\sum_{k=0}^{\infty}\frac{\left(-\frac{1}{17}\right)^k\left(-\frac{1}{2}\right)_k}{k!}\right)$$

$$\frac{\exp(-\pi\sqrt{18})}{0.000244141} = 4096\exp\left(-\frac{\pi\sum_{j=0}^{\infty}\operatorname{Res}_{s=-\frac{1}{2}+j}17^{-s}\,\Gamma\left(-\frac{1}{2}-s\right)\Gamma(s)}{2\sqrt{\pi}}\right)$$

Now:

$$e^{-6C+\phi} = 0.0066650177536$$

$$\exp\left(-\pi\sqrt{18}\right)\times\frac{1}{0.000244140625} =$$

$$e^{-\pi\sqrt{18}}\times\frac{1}{0.000244140625}$$

$$= 0.00666501785\ldots$$

From:

ln(0.00666501784619)

Input interpretation:

$\log(0.00666501784619)$

Result:

$-5.010882647757\ldots$

-5.010882647757…

Alternative representations:

$$\log(0.006665017846190000) = \log_e(0.006665017846190000)$$

$$\log(0.006665017846190000) = \log(a)\log_a(0.006665017846190000)$$

$$\log(0.006665017846190000) = -\text{Li}_1(0.993334982153810000)$$

Series representations:

$$\log(0.006665017846190000) = -\sum_{k=1}^{\infty} \frac{(-1)^k (-0.993334982153810000)^k}{k}$$

$$\log(0.006665017846190000) = 2 i \pi \left\lfloor \frac{\arg(0.006665017846190000 - x)}{2 \pi} \right\rfloor + \log(x) - \sum_{k=1}^{\infty} \frac{(-1)^k (0.006665017846190000 - x)^k x^{-k}}{k} \quad \text{for } x < 0$$

$$\log(0.006665017846190000) = \left\lfloor \frac{\arg(0.006665017846190000 - z_0)}{2\pi} \right\rfloor \log\left(\frac{1}{z_0}\right) + \log(z_0) + \left\lfloor \frac{\arg(0.006665017846190000 - z_0)}{2\pi} \right\rfloor \log(z_0) - \sum_{k=1}^{\infty} \frac{(-1)^k (0.006665017846190000 - z_0)^k z_0^{-k}}{k}$$

Integral representation:

$$\log(0.006665017846190000) = \int_1^{0.006665017846190000} \frac{1}{t}\, dt$$

In conclusion:

$$-6C + \phi = -5.010882647757 \ldots$$

and for C = 1, we obtain:

$$\phi = -5.010882647757 + 6 = 0.989117352243 = \boldsymbol{\phi}$$

Note that the values of n_s (spectral index) 0.965, of the average of the Omega mesons Regge slope 0.987428571 and of the dilaton 0.989117352243, are also connected to the following two Rogers-Ramanujan continued fractions:

$$\frac{e^{-\frac{\pi}{5}}}{\sqrt{(\varphi-1)\sqrt{5}} - \varphi + 1} = 1 - \cfrac{e^{-\pi}}{1 + \cfrac{e^{-2\pi}}{1 + \cfrac{e^{-3\pi}}{1 + \cfrac{e^{-4\pi}}{1 + \ldots}}}} \approx 0.9568666373$$

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\cfrac{e^{-\pi\sqrt{5}}}{1+\cfrac{e^{-2\pi\sqrt{5}}}{1+\cfrac{e^{-3\pi\sqrt{5}}}{1+\cfrac{e^{-4\pi\sqrt{5}}}{1+\dots}}}}\approx 0.9991104684$$

(http://www.bitman.name/math/article/102/109/)

Also performing the 512th root of the inverse value of the Pion meson rest mass 139.57, we obtain:

((1/(139.57)))^1/512

Input interpretation:

$$\sqrt[512]{\frac{1}{139.57}}$$

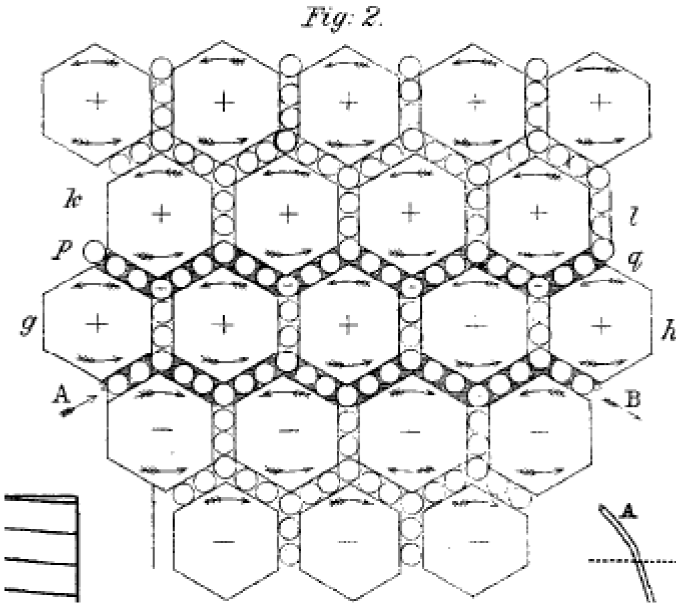
Result:

0.990400732708644027550973755713301415460732796178555551684...

0.99040073.... result very near to the dilaton value 0.989117352243 = ***ϕ*** and to the value of the following Rogers-Ramanujan continued fraction:

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\cfrac{e^{-\pi\sqrt{5}}}{1+\cfrac{e^{-2\pi\sqrt{5}}}{1+\cfrac{e^{-3\pi\sqrt{5}}}{1+\cfrac{e^{-4\pi\sqrt{5}}}{1+\dots}}}}\approx 0.9991104684$$

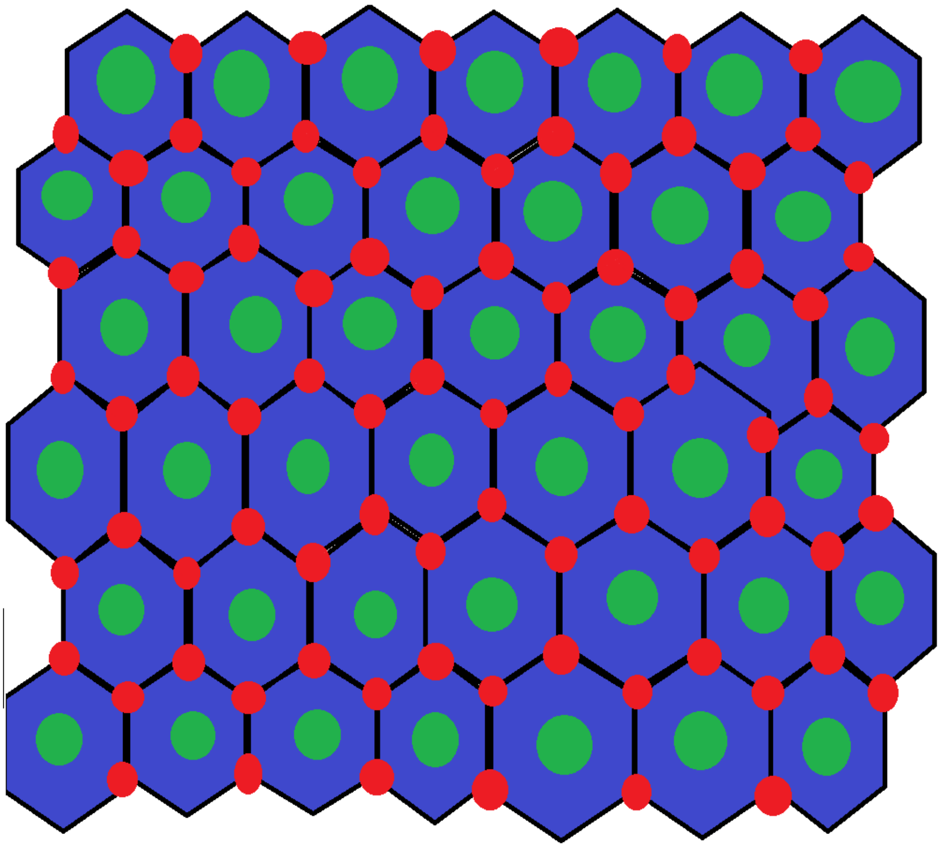
Fig. 1



It is therefore possible to consider the vortices of the "quantum vacuum" schematized as cubes or octahedrons (the + sign inside a given vortex indicates its counterclockwise rotation, while the - sign indicates its clockwise rotation). Between vortex and vortex there is a layer of "bubbles"-universes (or universes-spheres), which flows, as in the simplified two-dimensional drawing, from A to B

Fig. 2

Immagine dello Spazio-Tempo a scala quantistica: le cironferenze in rosso rappresentano i punti corrispondenti alle dimensioni compattificate e gli esagoni in blu, rappresentano le “fluttuazioni” (universi potenziali – cerchi verdi) del vuoto quantistico (2D)



Proposal

Image of space-time at quantum scale: the circles in red represent the points corresponding to the compactified dimensions and the hexagons in blue, represent the "fluctuations" (potential universes - green circles) of the quantum vacuum (2D). In reality, we will have n-dimensional hyperspheres in which the compactified dimensions "roll up" and octahedrons representing the "fluctuations", containing spheres (bubbles of potential universes), of the quantum vacuum

Acknowledgments

We would like to thank Professor **Augusto Sagnotti** theoretical physicist at Scuola Normale Superiore (Pisa – Italy) for his very useful explanations and his availability.

On the analysis of some formulas concerning various Ramanujan series for estimating the value of π. New possible mathematical connections with some sectors of Number Theory, Ramanujan Recurring Numbers, DN Constant and String Theory

Michele Nardelli[1], Antonio Nardelli

Abstract

In this paper, we analyze some formulas concerning various Ramanujan series for estimating the value of π. We describe the new possible mathematical connections with some sectors of Number Theory, Ramanujan Recurring Numbers, DN Constant and String Theory

From

(https://demonstrations.wolfram.com/RamanujansStrangeFormulaForPi/#more)

Regarding Pigreco's approximations, we remember Ramanujan's wonderful and famous formula:

$$\frac{1}{\pi} = \frac{2\sqrt{2}}{9801} \sum_{k=0}^{\infty} \frac{(4k)!(1103 + 26390k)}{(k!)^4 396^{4k}}$$

And from this formula we derive various expressions which we are going to analyze

We analyze the following formula:

$$\frac{1}{\pi} \approx \frac{2206\sqrt{2}}{9801}$$

we obtain:

Input

$$\frac{2206\sqrt{2}}{9801}$$

Decimal approximation

0.3183098784404701232176844531789199021859704272096263084815585656...

$$\frac{1}{\pi} \approx 0.3183098784404701232\ldots$$

1/π = 0.318309886183790671….

Indeed:

1/π

Input

$$\frac{1}{\pi}$$

Decimal approximation

0.3183098861837906715377675267450287240689192914809128974953346881
…

0.31830988618379067….

Property

$\frac{1}{\pi}$ is a transcendental number

Alternative representations

$$\frac{1}{\pi} = \frac{1}{180\,°}$$

$$\frac{1}{\pi} = -\frac{1}{i\log(-1)}$$

$$\frac{1}{\pi} = \frac{1}{\cos^{-1}(-1)}$$

$\log(x)$ is the natural logarithm

i is the imaginary unit

$\cos^{-1}(x)$ is the inverse cosine function

Series representations

$$\frac{1}{\pi} = \frac{1}{4 \sum_{k=0}^{\infty} \frac{(-1)^k}{1+2k}}$$

$$\frac{1}{\pi} = \frac{1}{\sum_{k=0}^{\infty} -\frac{4(-1)^k\, 1195^{-1-2k} \left(5^{1+2k} - 4 \times 239^{1+2k}\right)}{1+2k}}$$

$$\frac{1}{\pi} = \frac{1}{\sum_{k=0}^{\infty} \left(-\frac{1}{4}\right)^k \left(\frac{1}{1+2k} + \frac{2}{1+4k} + \frac{1}{3+4k}\right)}$$

Integral representations

$$\frac{1}{\pi} = \frac{1}{4 \int_0^1 \sqrt{1-t^2}\, dt}$$

$$\frac{1}{\pi} = \frac{1}{2 \int_0^{\infty} \frac{1}{1+t^2}\, dt}$$

$$\frac{1}{\pi} = \frac{1}{2 \int_0^1 \frac{1}{\sqrt{1-t^2}}\, dt}$$

Thus:

1/((2206*√2)/9801)

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x \rfloor$ is the floor function

i is the imaginary unit

And again:

27*sqrt((2(exp(1/((12389404344116838964769400621280991)/(1131379202490552979877435552947122965839872*√2)+((2206*√2)/9801)))+√3/2)+16)^2-√3)+1

Input

$$27 \sqrt{\left(\left(2 \left(\exp\left(1 \middle/ \left(12\,389\,404\,344\,116\,838\,964\,769\,400\,621\,280\,991 \middle/ \left(1\,131\,379\,202\,490\,552\,979\,877\,435\,552\,947\,122\,965\,839\,872 \sqrt{2}\right) + \frac{2206 \sqrt{2}}{9801}\right)\right)\right) + \frac{\sqrt{3}}{2}\right) + 16\right)^2 - \sqrt{3}} + 1$$

Decimal approximation

1728.9974575854862051447821463179914026591449046247037577119419668…

1728.9974575...

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve ($1728 = 8^2 * 3^3$). The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways ($10^3 + 9^3 = 12^3 + 1^3 = 1729$) and Ramanujan's recurring number)

Property

$$1+27\sqrt{\left(-\sqrt{3}+\left(16+2\left(\frac{\sqrt{3}}{2}+e\,\hat{}\,\left(1\middle/\left(12\,389\,404\,344\,116\,838\,964\,769\,400\,621\,280\,991\middle/\left(1\,131\,379\,202\,490\,552\,979\,877\,435\,552\,947\,122\,965\,839\,872\sqrt{2}\right)+\frac{2206\sqrt{2}}{9801}\right)\right)\right)\right)^2\right)}$$

is a transcendental number

We note that:

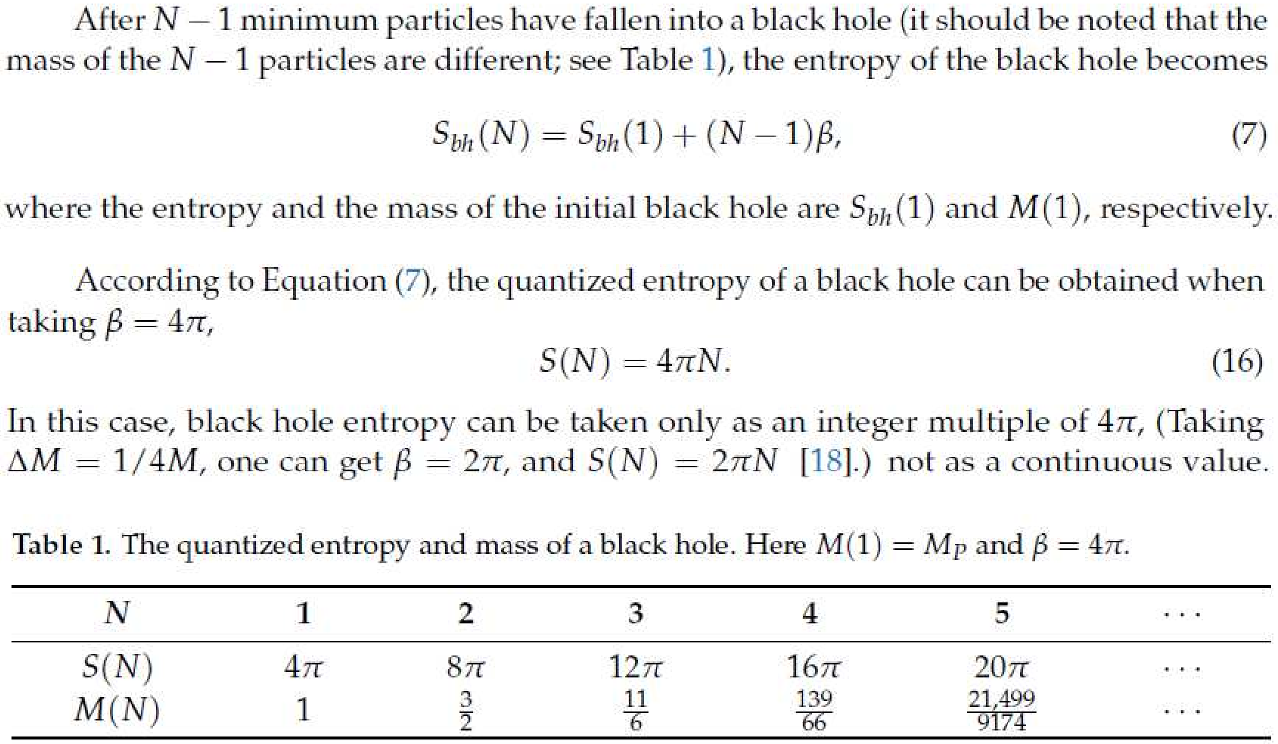
(He, D.; Cai, Q. **Area Entropy and Quantized Mass of Black Holes from Information Theory**. Entropy **2021**, 23, 858. https://doi.org/10.3390/e23070858)



After $N-1$ minimum particles have fallen into a black hole (it should be noted that the mass of the $N-1$ particles are different; see Table 1), the entropy of the black hole becomes

$$S_{bh}(N) = S_{bh}(1) + (N-1)\beta, \tag{7}$$

where the entropy and the mass of the initial black hole are $S_{bh}(1)$ and $M(1)$, respectively.

According to Equation (7), the quantized entropy of a black hole can be obtained when taking $\beta = 4\pi$,

$$S(N) = 4\pi N. \tag{16}$$

In this case, black hole entropy can be taken only as an integer multiple of 4π, (Taking $\Delta M = 1/4M$, one can get $\beta = 2\pi$, and $S(N) = 2\pi N$ [18].) not as a continuous value.

Table 1. The quantized entropy and mass of a black hole. Here $M(1) = M_P$ and $\beta = 4\pi$.

N	1	2	3	4	5	…
$S(N)$	4π	8π	12π	16π	20π	…
$M(N)$	1	$\frac{3}{2}$	$\frac{11}{6}$	$\frac{139}{66}$	$\frac{21{,}499}{9174}$	…

Now, from

$$\frac{1}{\pi} = \frac{2\sqrt{2}}{9801}\sum_{k=0}^{\infty}\frac{(4k)!(1103+26390k)}{(k!)^4 396^{4k}}$$

we consider:

((2√2)/(9801))*(sum((4k)!(1103+26390k))/((k!)^4*396^(4k)), k=0..infinity)

Input interpretation

$$\frac{2\sqrt{2}}{9801}\sum_{k=0}^{\infty}\frac{(4\,k)!\,(1103+26\,390\,k)}{(k!)^4\times 396^{4\,k}}$$

$n!$ is the factorial function

Result

$\frac{1}{\pi} \approx 0.31831$

0.31831

And:

1/(((2√2)/(9801))*(sum((4k)!(1103+26390k))/((k!)^4*396^(4k)), k=0..infinity))

Input interpretation

$$\frac{1}{\frac{2\sqrt{2}}{9801}\sum_{k=0}^{\infty}\frac{(4\,k)!\,(1103+26\,390\,k)}{(k!)^4\times 396^{4\,k}}}$$

$n!$ is the factorial function

Result

$\pi \approx 3.14159$

3.14159

From

Modular equations and approximations to π – *S. Ramanujan* -
Quarterly Journal of Mathematics, XLV, 1914, 350 – 372

We analyze the following formula

$$\pi = \frac{12}{\sqrt{130}}\log\left\{\frac{(2+\sqrt{5})(3+\sqrt{13})}{\sqrt{2}}\right\},$$

12/(sqrt(130)) ln(1/√2*((2+√5)(3+√13)))

Input

$$\frac{12}{\sqrt{130}} \log\left(\frac{1}{\sqrt{2}}\left(\left(2+\sqrt{5}\right)\left(3+\sqrt{13}\right)\right)\right)$$

$\log(x)$ is the natural logarithm

Result

$$6\sqrt{\frac{2}{65}} \log\left(\frac{\left(2+\sqrt{5}\right)\left(3+\sqrt{13}\right)}{\sqrt{2}}\right)$$

Decimal approximation

$\log(x)$ is the natural logarithm

ϕ is the golden ratio

C_{MRB} is the MRB constant

Result

4095.96786601864…

4095.96786601864…. ≈ 4096 = 64^2 , (Ramanujan Recurring Number) that multiplied by 2 give 8192, indeed:

The total amplitude vanishes for gauge group SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). (From: “Dilaton Tadpole for the Open Bosonic String “ Michael R. Douglas and Benjamin Grinstein - September 2,1986)

Result

1728.99322172501…

1728.99322172501….

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve ($1728 = 8^2 * 3^3$). The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways ($10^3 + 9^3 = 12^3 + 1^3 = 1729$) and Ramanujan's recurring number)

Expanded logarithmic form

1728.99

From which, we obtain also:

15.70796326794896*(89+21)+2*γ

Input interpretation

$15.70796326794896\,(89+21) + 2\,\gamma$

γ is the Euler-Mascheroni constant

Result

1729.030390804189…

1729.030390804189….

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve ($1728 = 8^2 * 3^3$). The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways ($10^3 + 9^3 = 12^3 + 1^3 = 1729$) and Ramanujan's recurring number)

(15.70796326794896*(89+21)+2*γ)^1/15+(MRB const)^(1-1/(4π)+π)

Input interpretation

$$\sqrt[15]{15.70796326794896\,(89+21)+2\,\gamma}+C_{\mathrm{MRB}}^{1-1/(4\pi)+\pi}$$

γ is the Euler-Mascheroni constant

C_{MRB} is the MRB constant

Result

1.6449399503479956...

1.6449399503479956…. ≈ ζ(2) = $\pi^2/6$ = 1.644934 (trace of the instanton shape and Ramanujan Recurring Number)

(1/27((15.70796326794896*(89+21)+2*γ)-1))^2-4/5*MRB const

Input interpretation

$$\left(\frac{1}{27}\,((15.70796326794896\,(89+21)+2\,\gamma)-1)\right)^2-\frac{4}{5}\,C_{\mathrm{MRB}}$$

γ is the Euler-Mascheroni constant

C_{MRB} is the MRB constant

Result

4095.993788476534...

4095.993788476534…≈ 4096 = 64^2 , (Ramanujan Recurring Number) that multiplied by 2 give 8192, indeed:

The total amplitude vanishes for gauge group SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). (From: "Dilaton Tadpole for the Open Bosonic String " Michael R. Douglas and Benjamin Grinstein - September 2,1986)

From

Modular equations and approximations to π - *Srinivasa Ramanujan* - Quarterly Journal of Mathematics, XLV, 1914, 350 – 372

We analyze the following expression.

$$\frac{355}{113}\left(1-\frac{.0003}{3533}\right)=3.1415926535897943\ldots,$$

We consider

355/113(1-(0.0003/3533))

Input

$$\frac{355}{113}\left(1-\frac{0.0003}{3533}\right)$$

Result

3.1415926535897943285683154279874458017829366103163848317632236135

0.5694100347337763114339639238968907178783721993598536808413351623

…

0.5694100347337….

From the two previous expressions:

$$\frac{4}{\pi\sqrt{3}} = \frac{3}{4} - \frac{31}{3\cdot4^3}\frac{1}{2}\frac{1\cdot3}{4^2} + \frac{59}{3^2\cdot4^5}\frac{1\cdot3}{2\cdot4}\frac{1\cdot3\cdot5\cdot7}{4^2\cdot8^2} - \cdots,$$

and

$$\frac{4}{\pi\sqrt{5}} = \frac{41}{72} - \frac{685}{5\cdot72^3}\frac{1}{2}\frac{1\cdot3}{4^2} + \frac{1329}{5^2\cdot72^5}\frac{1\cdot3}{2\cdot4}\frac{1\cdot3\cdot5\cdot7}{4^2\cdot8^2} - \cdots,$$

we obtain, after some easy calculations:

sqrt(2(4/(π√3) + 4/(π√5)))

Input

$$\sqrt{2\left(\frac{4}{\pi\sqrt{3}} + \frac{4}{\pi\sqrt{5}}\right)}$$

Decimal approximation

1.6152493483233258246211711277575794357405536815500427702791663445

…

1.6152493483233…. result that is a very good approximation to the value of the golden ratio 1.618033988749… (Ramanujan Recurring Number)

Property

$\sqrt{2\left(\frac{4}{\sqrt{3}\,\pi} + \frac{4}{\sqrt{5}\,\pi}\right)}$ is a transcendental number

Alternate forms

$$\frac{2\times 2^{3/4}\sqrt[4]{\frac{4}{15}+\frac{1}{\sqrt{15}}}}{\sqrt{\pi}}$$

$$2\sqrt{\frac{2\left(5\sqrt{3}+3\sqrt{5}\right)}{15\,\pi}}$$

All 2nd roots of 2 (4/(sqrt(3) π)+4/(sqrt(5) π))

$$\sqrt{2\left(\frac{4}{\sqrt{3}\,\pi}+\frac{4}{\sqrt{5}\,\pi}\right)}\;e^{0}\approx 1.6152 \quad \text{(real, principal root)}$$

$$\sqrt{2\left(\frac{4}{\sqrt{3}\,\pi}+\frac{4}{\sqrt{5}\,\pi}\right)}\;e^{i\pi}\approx -1.6152 \quad \text{(real root)}$$

Series representations

$$\sqrt{2\left(\frac{4}{\pi\sqrt{3}}+\frac{4}{\pi\sqrt{5}}\right)}=\sqrt{-1+\frac{8\left(\frac{1}{\sqrt{3}}+\frac{1}{\sqrt{5}}\right)}{\pi}}\;\sum_{k=0}^{\infty}\binom{\frac{1}{2}}{k}\left(-1+\frac{8\left(\frac{1}{\sqrt{3}}+\frac{1}{\sqrt{5}}\right)}{\pi}\right)^{-k}$$

-0.9003 (real root)

From:

$$G_{205} = \left(\frac{1+\sqrt{5}}{2}\right)\left(\frac{3\sqrt{5}+\sqrt{41}}{2}\right)^{\frac{1}{4}}\left\{\sqrt{\left(\frac{7+\sqrt{41}}{8}\right)}+\sqrt{\left(\frac{\sqrt{41}-1}{8}\right)}\right\}$$

we obtain:

(1/2*(1+√5))*(1/2*(3√5+√41))^(1/4)*[sqrt(1/8*(7+√41))+sqrt(1/8*(√41-1))]

Input

$$\left(\frac{1}{2}\left(1+\sqrt{5}\right)\right)\sqrt[4]{\frac{1}{2}\left(3\sqrt{5}+\sqrt{41}\right)}\left(\sqrt{\frac{1}{8}\left(7+\sqrt{41}\right)}+\sqrt{\frac{1}{8}\left(\sqrt{41}-1\right)}\right)$$

Result

$$\frac{1}{2}\left(1+\sqrt{5}\right)\sqrt[4]{\frac{1}{2}\left(3\sqrt{5}+\sqrt{41}\right)}\left(\frac{1}{2}\sqrt{\frac{1}{2}\left(\sqrt{41}-1\right)}+\frac{1}{2}\sqrt{\frac{1}{2}\left(7+\sqrt{41}\right)}\right)$$

Decimal approximation

5.4789397137741778631422933388746486067850216067301672332619100408
…

5.478939713774177863….

Alternate forms

$$\frac{1}{8}\left(1+\sqrt{5}\right)\sqrt[4]{\left(3\sqrt{5}+\sqrt{41}\right)2}\left(\sqrt{\sqrt{41}-1}+\sqrt{7+\sqrt{41}}\right)$$

$$\frac{1}{4}\left(1+\sqrt{5}\right)\sqrt{3+\sqrt{41}+\sqrt{34+6\sqrt{41}}}$$

root of $x^{16}-43x^{8}+1$ near $x=1.60013$

$$\frac{(1+\sqrt{5})\sqrt[4]{3\sqrt{5}+\sqrt{41}}\left(\sqrt{\sqrt{41}-1}+\sqrt{7+\sqrt{41}}\right)}{4\times 2^{3/4}}$$

Expanded form

$$\frac{\sqrt{\sqrt{41}-1}\sqrt[4]{3\sqrt{5}+\sqrt{41}}}{4\times 2^{3/4}}+\frac{\sqrt{5(\sqrt{41}-1)}\sqrt[4]{3\sqrt{5}+\sqrt{41}}}{4\times 2^{3/4}}+$$
$$\frac{\sqrt{7+\sqrt{41}}\sqrt[4]{3\sqrt{5}+\sqrt{41}}}{4\times 2^{3/4}}+\frac{\sqrt{5(7+\sqrt{41})}\sqrt[4]{3\sqrt{5}+\sqrt{41}}}{4\times 2^{3/4}}$$

Minimal polynomial

$$x^{32}-903x^{28}+1688x^{24}-315x^{20}+1806x^{16}+315x^{12}+1688x^{8}+903x^{4}+1$$

And from

$$\pi=\frac{24}{\sqrt{n}}\log(2^{\frac{1}{4}}G_n)$$

we obtain:

24/(sqrt(205))*ln(((2^(1/4)*((1/2*(1+√5))*(1/2*(3√5+√41))^(1/4)*[sqrt(1/8*(7+√41))+sqrt(1/8*(√41-1))]))))))

Input

$$\frac{24}{\sqrt{205}}\log\left(\sqrt[4]{2}\left(\left(\frac{1}{2}(1+\sqrt{5})\right)\sqrt[4]{\frac{1}{2}(3\sqrt{5}+\sqrt{41})}\left(\sqrt{\frac{1}{8}(7+\sqrt{41})}+\sqrt{\frac{1}{8}(\sqrt{41}-1)}\right)\right)\right)$$

log(x) is the natural logarithm

Result

$$\frac{24\log\left(\frac{1}{2}\left(1+\sqrt{5}\right)\sqrt[4]{3\sqrt{5}+\sqrt{41}}\left(\frac{1}{2}\sqrt{\frac{1}{2}\left(\sqrt{41}-1\right)}+\frac{1}{2}\sqrt{\frac{1}{2}\left(7+\sqrt{41}\right)}\right)\right)}{\sqrt{205}}$$

$\Gamma(x)$ is the gamma function

Now, we have:

$$g_{310} = \left(\frac{1+\sqrt{5}}{2}\right)\sqrt{(1+\sqrt{2})}\left\{\sqrt{\left(\frac{7+2\sqrt{10}}{4}\right)}+\sqrt{\left(\frac{3+2\sqrt{10}}{4}\right)}\right\},$$

(1/2*(1+√5))*sqrt(1+√2)*[sqrt(1/4*(7+2√10))+sqrt(1/4*(3+2√10))]

Input

$$\left(\frac{1}{2}(1+\sqrt{5})\right)\sqrt{1+\sqrt{2}}\left(\sqrt{\frac{1}{4}(7+2\sqrt{10})}+\sqrt{\frac{1}{4}(3+2\sqrt{10})}\right)$$

Result

$$\frac{1}{2}\sqrt{1+\sqrt{2}}\,(1+\sqrt{5})\left(\frac{1}{2}\sqrt{3+2\sqrt{10}}+\frac{1}{2}\sqrt{7+2\sqrt{10}}\right)$$

Decimal approximation

8.4269941500362075657975840194824130333145055263384990174962280582
…

8.4269941500362075….

Alternate forms

$$\frac{1}{4}\left(\sqrt{3+2\sqrt{10}}+\sqrt{10}+\sqrt{5(3+2\sqrt{10})}+\sqrt{7+2\sqrt{10}}+5\right)\sqrt{1+\sqrt{2}}$$

$$\frac{1}{4}\sqrt{1+\sqrt{2}}\,(1+\sqrt{5})\left(\sqrt{2}+\sqrt{5}+\sqrt{3+2\sqrt{10}}\right)$$

$$\frac{1}{8}\left(\sqrt{2-2i}+\sqrt{2+2i}\right)(1+\sqrt{5})\left(\sqrt{3+2\sqrt{10}}+\sqrt{7+2\sqrt{10}}\right)$$

Expanded form

$$\frac{1}{4}\sqrt{(1+\sqrt{2})(3+2\sqrt{10})}+\frac{1}{4}\sqrt{5(1+\sqrt{2})(3+2\sqrt{10})}+\frac{1}{4}\sqrt{(1+\sqrt{2})(7+2\sqrt{10})}+\frac{1}{4}\sqrt{5(1+\sqrt{2})(7+2\sqrt{10})}$$

Minimal polynomial

$$x^{16}-70x^{14}-73x^{12}+70x^{10}-52x^{8}-70x^{6}-73x^{4}+70x^{2}+1$$

And from

$$\pi=\frac{24}{\sqrt{n}}\log(2^{\frac{1}{4}}g_n)$$

we obtain:

24/(sqrt(310))*ln(((2^(1/4)*((1/2*(1+√5))*sqrt(1+√2)*[sqrt(1/4*(7+2√10))+sqrt(1/4*(3+2√10))]))))

Input

$$\frac{24}{\sqrt{310}} \log\left(\sqrt[4]{2}\left(\left(\frac{1}{2}(1+\sqrt{5})\right)\sqrt{1+\sqrt{2}}\left(\sqrt{\frac{1}{4}(7+2\sqrt{10})}+\sqrt{\frac{1}{4}(3+2\sqrt{10})}\right)\right)\right)$$

$\log(x)$ is the natural logarithm

Result

$$12\sqrt{\frac{2}{155}}\log\left(\frac{\sqrt{1+\sqrt{2}}\,(1+\sqrt{5})\left(\frac{1}{2}\sqrt{3+2\sqrt{10}}+\frac{1}{2}\sqrt{7+2\sqrt{10}}\right)}{2^{3/4}}\right)$$

sqrt(1/(1/6(24/(√(1225))*ln(((2^(1/4)*((1/2*(1+√5))*(6+√35)^(1/4)*(1/2*(7^(1/4)+√(4+√7)))^(3/2)*[√(1/8*(43+15√7+(8+3 √7) √(10√7)))+√(1/8*(35+15√7+(8+3√7) √(10√7)))])))))^2)*(4/3))

Input

$$\sqrt{\left(1\Big/\left(\frac{1}{6}\left(\frac{24}{\sqrt{1225}}\log\left(\sqrt[4]{2}\left(\left(\frac{1}{2}(1+\sqrt{5})\right)\sqrt[4]{6+\sqrt{35}}\left(\frac{1}{2}\left(\sqrt[4]{7}+\sqrt{4+\sqrt{7}}\right)\right)^{3/2}\left(\sqrt{\frac{1}{8}\left(43+15\sqrt{7}+(8+3\sqrt{7})\sqrt{10\sqrt{7}}\right)}+\sqrt{\frac{1}{8}\left(35+15\sqrt{7}+(8+3\sqrt{7})\sqrt{10\sqrt{7}}\right)}\right)\right)\right)\right)\right)^2\right)\times\frac{4}{3}\right)}$$

log(x) is the natural logarithm

Exact result

$$35\Big/\left(6\sqrt{2}\log\left(\frac{1}{4}(1+\sqrt{5})\sqrt[4]{\frac{1}{2}(6+\sqrt{35})}\left(\sqrt[4]{7}+\sqrt{4+\sqrt{7}}\right)^{3/2}\left(\frac{1}{2\sqrt{\frac{2}{35+15\sqrt{7}+\sqrt[4]{7}\sqrt{10}(8+3\sqrt{7})}}}+\frac{1}{2\sqrt{\frac{2}{43+15\sqrt{7}+\sqrt[4]{7}\sqrt{10}(8+3\sqrt{7})}}}\right)\right)\right)$$

Decimal approximation

0.9003163161571060695551991910067405826645741499548737161768844755 …

0.9003163161571060695…. ≈ 0.9003163161571…. $= \frac{2\sqrt{2}}{\pi}$ (DN Constant)

Property

$$35 \Bigg/ \left(6\sqrt{2}\,\log\left(\frac{1}{4}(1+\sqrt{5})\sqrt[4]{\frac{1}{2}(6+\sqrt{35})}\left(\sqrt[4]{7}+\sqrt{4+\sqrt{7}}\right)^{3/2}\left(\frac{1}{2\sqrt{\frac{2}{35+15\sqrt{7}+\sqrt[4]{7}\sqrt{10}(8+3\sqrt{7})}}}+\frac{1}{2\sqrt{\frac{2}{43+15\sqrt{7}+\sqrt[4]{7}\sqrt{10}(8+3\sqrt{7})}}}\right)\right)\right)$$

is a transcendental number

Now, we have:

$$G_{505}^2 = (2+\sqrt{5})\sqrt{\left\{\left(\frac{1+\sqrt{5}}{2}\right)(10+\sqrt{101})\right\}} \times\left\{\left(\frac{5\sqrt{5}+\sqrt{101}}{4}\right)+\sqrt{\left(\frac{105+\sqrt{505}}{8}\right)}\right\},$$

(2+√5)*sqrt((1/2*(1+√5))(10+√101))*[(1/4*(5√5+√101))+sqrt(1/8*(105+√505))]

Input

$$(2+\sqrt{5})\sqrt{\left(\frac{1}{2}(1+\sqrt{5})\right)(10+\sqrt{101})}\left(\frac{1}{4}(5\sqrt{5}+\sqrt{101})+\sqrt{\frac{1}{8}(105+\sqrt{505})}\right)$$

Result

$$(2+\sqrt{5})\sqrt{\frac{1}{2}(1+\sqrt{5})(10+\sqrt{101})}\left(\frac{1}{4}(5\sqrt{5}+\sqrt{101})+\frac{1}{2}\sqrt{\frac{1}{2}(105+\sqrt{505})}\right)$$

On the application of the formulas of the volumes of an octahedron and a sphere

With regard to a sphere inscribed in an octahedron, we have the following formulas.

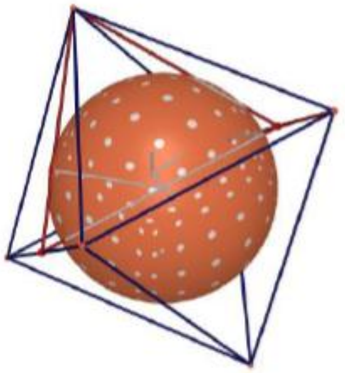

Fig: sphere inscribed in an octahedron

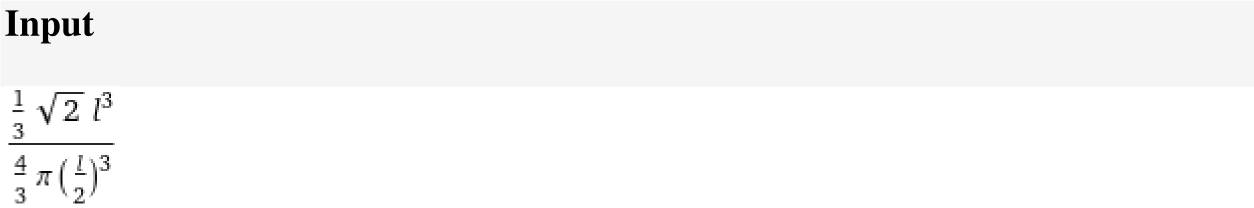
$V_0 = \frac{1}{3}\sqrt{2}\, l^3$

$V_s = \frac{4}{3}\pi r^3$; where $r_s = (l/2)$

With regard the ratio between the two above formulas (octahedron and sphere)

(1/3*√2*l^3)/(4/3*π*(l/2)^3)

we obtain:



Input

$$\frac{\frac{1}{3}\sqrt{2}\, l^3}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^3}$$

Result

$\frac{\sqrt{2}\ 2}{\pi}$ (for $l \neq 0$)

Decimal approximation

Exact result

24

24

The value 24 is linked to the "Ramanujan function" (an elliptic modular function that satisfies the need for "conformal symmetry") that has 24 "modes" corresponding to the physical vibrations of a bosonic string representing a bosons. From the analysis, we observe that the is no number theoretic connection with physical vibrations of fermionic strings at extremally low entropy. This fact is confirmed by the fact that the Higgs bosons at the moment of the big bang and infinitesimally shortly thereafter, facilitated the creation of fermions (matter and antimatter particles) [8]. Thus we note that the ingredients for the formation of electromagnetic radiation from photons (a Boson), and the formation of matter from the Higgs boson after the big bang, are intrinsic properties of the vacuum energy in pre-big bang.

Series representations

$$\frac{(6\pi\sqrt{2})(\sqrt{2}\,l^3)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3}=12\sqrt{z_0}^2\left(\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(2-z_0)^k z_0^{-k}}{k!}\right)^2$$

for (not ($z_0 \in \mathbb{R}$ and $-\infty < z_0 \le 0$))

$$\frac{(6\pi\sqrt{2})(\sqrt{2}\,l^3)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3} = 12\exp^2\left(i\pi\left\lfloor\frac{\arg(2-x)}{2\pi}\right\rfloor\right)\sqrt{x}^2\left(\sum_{k=0}^{\infty}\frac{(-1)^k(2-x)^k x^{-k}\left(-\frac{1}{2}\right)_k}{k!}\right)^2$$

for $(x \in \mathbb{R}$ and $x < 0)$

$$\frac{(6\pi\sqrt{2})(\sqrt{2}\,l^3)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3} =$$

$$12\left(\frac{1}{z_0}\right)^{\lfloor\arg(2-z_0)/(2\pi)\rfloor} z_0^{1+\lfloor\arg(2-z_0)/(2\pi)\rfloor}\left(\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(2-z_0)^k z_0^{-k}}{k!}\right)^2$$

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x\rfloor$ is the floor function

i is the imaginary unit

This could imply that all matter (fermions) was preceded by bosons. That is, before the Big Bang, from perturbations of the vacuum energy itself, bosons were created, and successively at the Big Bang, and infinitesimally shortly after the Big Bang, fermions, were created from the vacuum energy that underwent a violent “breaking” that formed a hot plasma. of particle-antiparticle pairs. This therefore implies that quantum gravity was not necessarily “dark” to some extent, because a photon (light particle) is itself a boson. Therefore, a big bang was not necessarily the moment of the creation of light, but of the creation of matter (fermions) from vacuum energy, as this undergoes further "breaking" in the cosmological constant, in the hot plasma of matter and in the energy dark.

(2π*√2((1/3*√2*l^3)/(4/3*π*(l/2)^3)))^4

Input

$$\left(2\pi\sqrt{2}\times\frac{\frac{1}{3}\sqrt{2}\,l^3}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^3}\right)^4$$

Exact result

4096

4096 = 64^2 , (Ramanujan Recurring Number) that multiplied by 2 give 8192, indeed:

The total amplitude vanishes for gauge group SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). (From: "Dilaton Tadpole for the Open Bosonic String " Michael R. Douglas and Benjamin Grinstein - September 2,1986)

27*sqrt((2π*√2((1/3*√2*l^3)/(4/3*π*(l/2)^3)))^4)+1

Input

From:

https://www.academia.edu/75787512/The_Theory_of_String_A_Candidate_for_a_Generalized_Unification_Model

With regard 8, this value is linked to the "Ramanujan function" (an elliptic modular function that satisfies the need for "conformal symmetry") that has 8 "modes" corresponding to the physical vibrations of a superstring. The value 24, instead, is linked to the "Ramanujan function" (an elliptic modular function that satisfies the need for "conformal symmetry") that has 24 "modes" corresponding to the physical vibrations of a bosonic string representing a bosons.

The Einstein's field equation and the String Theory.

The Einstein's field equation which includes the cosmological constant is:

$$R_{\mu\nu} - \frac{1}{2} g_{\mu\nu} R - \lambda g_{\mu\nu} = -8\pi \mathrm{G} \mathrm{T}_{\mu\nu} \quad (8)$$

where $R_{\mu\nu}$ is the Ricci tensor, R its trace, λ the cosmological constant, $g_{\mu\nu}$ the metric tensor of the space geometry, G the Newton's gravitational constant and $T_{\mu\nu}$ the tensor representing the properties of energy, matter and momentum.

The left hand-side of (8) represents the gravitational field and, consequently, the warped space-time, while the right hand-side represents the matter, i.e. the sources of the gravitational field.

In string theory the gravity is related to the gravitons which are bosons, whereas the matter is related to fermions. It follows that the left and right hand of (8) may be respectively related to the action of bosonic and of superstrings.

The actions of bosonic string and superstring (also containing fermions) are connected by the Palumbo-Nardelli relation (Palumbo et al. 2005):

$$-\int d^{26}x\sqrt{g}\left[-\frac{R}{16\pi G}-\frac{1}{8}g^{\mu\rho}g^{\nu\sigma}Tr\left(G_{\mu\nu}G_{\rho\sigma}\right)f(\varphi)-\frac{1}{2}g^{\mu\nu}\partial_{\mu}\varphi\partial_{\nu}\varphi\right]=$$

$$=\int_{0}^{\infty}\frac{1}{2\kappa_{10}^{2}}\int d^{10}x\sqrt{-G}e^{-2\Phi}\left[R+4\partial_{\mu}\Phi\partial^{\mu}\Phi-\frac{1}{2}|\widetilde{H}_{3}|^{2}-\frac{\kappa_{10}^{2}}{g_{10}^{2}}Tr_{v}\left(|F_{2}|^{2}\right)\right]$$

The sign minus in the above equation comes from the inversion of any relationship.

Now, we have the following convex regular polyhedrons volumes:

$\frac{\sqrt{2}}{12}d^3$ Tetrahedron Volume

$\frac{\sqrt{2}}{3}d^3$ Octahedron Volume

$\frac{5}{12}(3+\sqrt{5})d^3$ Icosahedron Volume

Regarding the Sphere the volume is

$$V=\frac{4}{3}\pi r^3$$

With regard the sphere inscribed in a Tetrahedron, we have, for $r=\frac{d}{2}$, the following ratio:

$$\frac{V_T}{V_S}=\frac{\frac{\sqrt{2}}{12}d^3}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}$$

Thus:

(((√2 d^3)/12))*1/(4/3*π*(d/2)^3)

Input

$$\left(\frac{1}{12}\left(\sqrt{2}\,d^3\right)\right)\times\frac{1}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}$$

Result

$$\frac{\sqrt{2}}{2\pi}\quad(\text{for } d \neq 0)$$

Decimal approximation

$$\sqrt[2\pi]{\frac{5}{2}}\ \left(\left(\pi\left(\frac{1}{z_0}\right)^{-\lfloor\arg(2-z_0)/(2\pi)\rfloor} z_0^{-1-\lfloor\arg(2-z_0)/(2\pi)\rfloor}\left(3+\left(\frac{1}{z_0}\right)^{1/2\lfloor\arg(5-z_0)/(2\pi)\rfloor} z_0^{1/2+1/2\lfloor\arg(5-z_0)/(2\pi)\rfloor}\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(5-z_0)^k z_0^{-k}}{k!}\right)\right)\middle/\left(\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(2-z_0)^k z_0^{-k}}{k!}\right)^2\right)\hat{}\left(\frac{1}{2\pi}\right)$$

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x\rfloor$ is the floor function

i is the imaginary unit

Integral representation

$$(1+z)^a = \frac{\int_{-i\,\infty+\gamma}^{i\,\infty+\gamma} \frac{\Gamma(s)\,\Gamma(-a-s)}{z^s}\,d\,s}{(2\,\pi\,i)\,\Gamma(-a)} \quad \text{for } (0 < \gamma < -\operatorname{Re}(a) \text{ and } |\arg(z)| < \pi)$$

$\Gamma(x)$ is the gamma function

$\operatorname{Re}(z)$ is the real part of z

$|z|$ is the absolute value of z

Furthermore, from the formula

$$2^{-1/\pi}\,\sqrt[2\pi]{5\left(3+\sqrt{5}\right)\pi}$$

we obtain also:

(4 (1.6180085459)^(2 π))/(5 (3 + sqrt(5))) = 3.1415926535

Indeed:

$$\frac{4\times 1.6180085459^{2\,\pi}}{5\left(3+\sqrt{5}\right)}$$

3.141592653588487162422193250985871527893102518924557617007810061 3…

3.1415926535…. = π (Ramanujan Recurring Number)

From the following extended DN Constant (“Unitary Formula”)

$$\sqrt[2\pi]{\frac{\frac{5}{12}\left(3+\sqrt{5}\right)d^{3}}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^{3}}\times\frac{1}{\frac{\frac{1}{3}\sqrt{2}a^{3}}{\frac{4}{3}\pi\left(\frac{a}{2}\right)^{3}}}\times\frac{1}{\frac{\sqrt{2}}{12}d^{3}\cdot\frac{1}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^{3}}}}\times\sqrt[3]{-\frac{q}{2}+\sqrt{\frac{q^{2}}{4}+\frac{p^{3}}{27}}}+\sqrt[3]{-\frac{q}{2}-\sqrt{\frac{q^{2}}{4}+\frac{p^{3}}{27}}}$$

with regard

$$\sqrt[3]{-\frac{q}{2}+\sqrt{\frac{q^{2}}{4}+\frac{p^{3}}{27}}}+\sqrt[3]{-\frac{q}{2}-\sqrt{\frac{q^{2}}{4}+\frac{p^{3}}{27}}}$$

for q = 1729 and p = 4096, we obtain by changing the sign in the algebraic sum of the aforementioned Cardano’s Formula and after some calculations:

$$2^{-1/\pi}\sqrt[2\pi]{5\left(3+\sqrt{5}\right)\pi}$$

multiplied by

$$\sqrt[9]{\sqrt[3]{-\frac{1729}{2}+\sqrt{\frac{1729^{2}}{4}+\frac{4096^{3}}{27}}}-\sqrt[3]{-\frac{1729}{2}-\sqrt{\frac{1729^{2}}{4}+\frac{4096^{3}}{27}}}}$$

and performing the ninth root of the entire expression:

√((2^(-1/π)(5(3+√(5))π)^(1/(2π)))((∛(-1729/2+√(1729^2/4+4096^3/27)) -∛(-1729/2-√(1729^2/4+4096^3/27)))^1/9))

we obtain:

$$\sqrt{\left(\left(2^{-1/\pi}\sqrt[2\pi]{5\left(3+\sqrt{5}\right)\pi}\right)\sqrt[9]{\sqrt[3]{-\frac{1729}{2}+\sqrt{\frac{1729^2}{4}+\frac{4096^3}{27}}}-\sqrt[3]{-\frac{1729}{2}-\sqrt{\frac{1729^2}{4}+\frac{4096^3}{27}}}}\right)}$$

$$2^{-1/(2\pi)}\sqrt[18]{\sqrt[3]{\frac{\sqrt{\frac{274958621851}{3}}}{6}-\frac{1729}{2}}+\sqrt[3]{\frac{1729}{2}+\frac{\sqrt{\frac{274958621851}{3}}}{6}}}\sqrt[4\pi]{5\left(3+\sqrt{5}\right)\pi}$$

i.e.

2^(-1/(2π)) ((-1729/2+√(274958621851/3)/6)^(1/3)+(1729/2 + √(274958621851/3)/6)^(1/3))^(1/18) (5(3+√(5)) π)^(1/(4π))

= 1.61549140391….

The general "unitary" formula, which derives from DN Constant, is the following:

$$\sqrt{2\times\frac{2\cdot\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{1}{\pi\cdot 0.9991104684}\left(C\times \mathrm{R}\times 2.33\cdot 10^{-13}\right)}}\cong 1.61803398\ldots=\frac{\sqrt{5}+1}{2}$$

Where $\frac{2\sqrt{2}}{\pi}$ is the Del Gaudio-Nardelli Constant, 0.9991104684 is the value of the following Rogers-Ramanujan continued fraction:

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\frac{e^{-\pi\sqrt{5}}}{1+\frac{e^{-2\pi\sqrt{5}}}{1+\frac{e^{-3\pi\sqrt{5}}}{1+\frac{e^{-4\pi\sqrt{5}}}{1+\dots}}}}\approx 0.9991104684$$

C is any constant or solution to an equation, R is the radius of the Universe and $2.33*10^{-13}$ is the temperature of the universe expressed in GeV.

For example, $C = 9.9128$, inserting a radius of the Universe, which we have calculated, equal to $R = 2.06274*10^{12}$ years, from DN Constant "unitary" formula, we obtain:

√(2×(2·(((2√2)/π))^(1/16))/(1/(π·0.9991104684) (9.9128×(2.06274 × 10^12)×2.33·10^(-13))))

$$\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{1}{\pi\times0.9991104684}\times\frac{9.9128\times2.06274\times10^{12}\times2.33}{10^{13}}}}$$

1.6180359123482642354401744088347098542545273508401733563064818107
...

1.618035912348…. result that is a very good approximation to the value of the golden ratio 1.618033988749… (Ramanujan Recurring Number)

We obtain also:

(√(2×(2·(((2√2)/π))^(1/16))/(1/(π·0.9991104684) (9.9128×(2.06274 × 10^12)×2.33·10^(-13)))))dxdydz

Indefinite integral assuming all variables are real

$0.809018\, x^2\, y\, z + \text{constant}$

Definite integral over a cube of edge length 2 L

$$\int_{-L}^{L}\int_{-L}^{L}\int_{-L}^{L} 1.61804\, dx\, dy\, dz = 12.9443\, L^3$$

Definite integral over a sphere of radius R

$$\iiint_{x^2+y^2+z^2<R^2} 1.61804\, dz\, dy\, dx = 6.77761\, R^3$$

From which, for L = R = 1 , dividing the two definite integral results by the original expression, we obtain:

12.9443/(√(2×(2·(((2√2)/π))^(1/16))/(1/(π·0.9991104684) (9.9128×(2.06274 × 10^12)×2.33·10^(-13)))))

Input interpretation

$$\frac{12.9443}{\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{1}{\pi\times 0.9991104684}\times\frac{9.9128\times 2.06274\times 10^{12}\times 2.33}{10^{13}}}}}$$

12.5664…. ≈ 4π = Bekenstein-Hawking (S_{BH}) black hole entropy

New fundamental formula deriving from DN Constant

The DN Constant (Del Gaudio-Nardelli Constant) equals (2√2)/π) is defined as the ratio of the volume of an octahedron to the volume of a sphere and is an intriguing mathematical concept. Michele Nardelli hypothesized that the regular octahedron represents a phase in which the universe is highly symmetrical and with very low entropy. On the other hand, the sphere (which is inscribed in the octahedron, i.e. is "inside" it) represents the universe emerging from the quantum vacuum, which over time increases entropy and undergoes various symmetry breakings. This occurs in a regime of eternal inflation.

From the following expression

√(2×(2·(((2√2)/π)^(1/16)))/(4096/(π·0.9991104684) (((1.616255*10^-35)/(1.1056*10^-52))×C×R)))

$$\sqrt{2 \times \frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{4096}{\pi \times 0.9991104684}\left(\frac{1.616255 \times 10^{-35}}{1.1056 \times 10^{-52}} C\, R\right)}}$$

which comes from the DN Constant, with 1.616255*10^{-35} which is equal to the Planck length, 1.1056*10^{-52} which is equal to the Cosmological Constant, C = 1729 which corresponds to the Hardy-Ramanujan number and R = 4.6018401361 × 10^{-24}, which represents the radius of the Universe, we obtain:

√(2×(2·(((2√2)/π)^(1/16)))/(4096/(π·0.9991104684) (((1.616255*10^-35)/(1.1056*10^-52))×1729×4.6018401361 × 10^-24))) = 1.6180329973...

$$\sqrt{2 \times \frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{4096}{\pi \times 0.9991104684}\left(\frac{1.616255 \times 10^{-35}}{1.1056 \times 10^{-52}} \times 1729 \times 4.6018401361 \times 10^{-24}\right)}}$$

1.6180329973075324915067570166297467464225772608929671407919395903
...

1.6180329973075…

We have also the following formula:

√(2×(2·(((2√2)/π)^(1/16)))/(4096/(π·0.9991104684) (((1.616255*10^-35)/(1.1056*10^-52))×1729×(4.4525642121 × 10^-24))))

Input interpretation

$$\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{4096}{\pi\times0.9991104684}\left(\frac{1.616255\times10^{-35}}{1.1056\times10^{-52}}\times1729\times4.4525642121\times10^{-24}\right)}}$$

Result

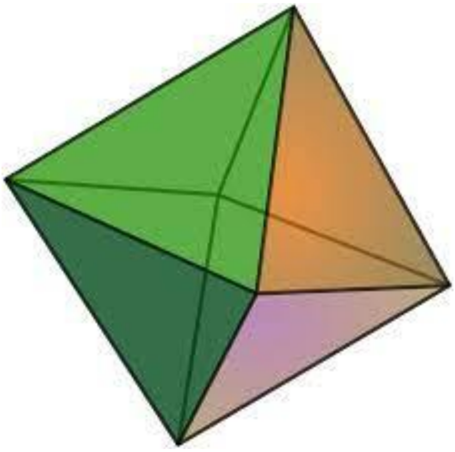
Result

3.1415922573146993939950039231605796469731171781644423955790024797

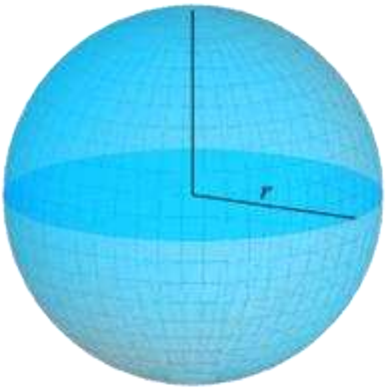
…

3.14159225731469…

Now, we have that:



Octahedron



Sphere

Given the value of a volume, independently of the solid, following the Poincaré Conjecture, we compare any solid "without holes" and a sphere. If we compare an octahedron with a sphere, we have:

$$\frac{4}{3}\pi r^3 = \frac{1}{3}\sqrt{2}a^3$$

If we consider the radius of the sphere as an unknown, we must find the value of the side of the octahedron which allows us to equalize the two volumes and which will give us the DN Constant as a result (which will therefore be equal to the radius of the sphere).

From

$$\frac{4}{3}\pi r^3 = \frac{1}{3}\sqrt{2}a^3$$

To find r we perform the following calculation:

$$r^3 = \frac{\frac{1}{3}\sqrt{2}a^3}{\frac{4}{3}\pi} = \frac{1}{3}\sqrt{2}a^3 \cdot \frac{3}{4\pi} = \frac{\sqrt{2}a^3}{4\pi} = \frac{\sqrt{2}\cdot\sqrt{2}a^3}{\sqrt{2}\cdot 4\pi} = \frac{2a^3}{\sqrt{2}\cdot 4\pi} = \frac{a^3}{2\sqrt{2}\pi}$$

$$r^3 = \frac{a^3}{2\sqrt{2}\pi}; \qquad r = \sqrt[3]{\frac{a^3}{2\sqrt{2}\pi}} = \frac{a}{\sqrt[3]{2\sqrt{2}\pi}}$$

To find a, we have, for

$$r = \frac{2\sqrt{2}}{\pi}; \qquad \frac{a}{\sqrt[3]{2\sqrt{2}\pi}} = \frac{2\sqrt{2}}{\pi};$$

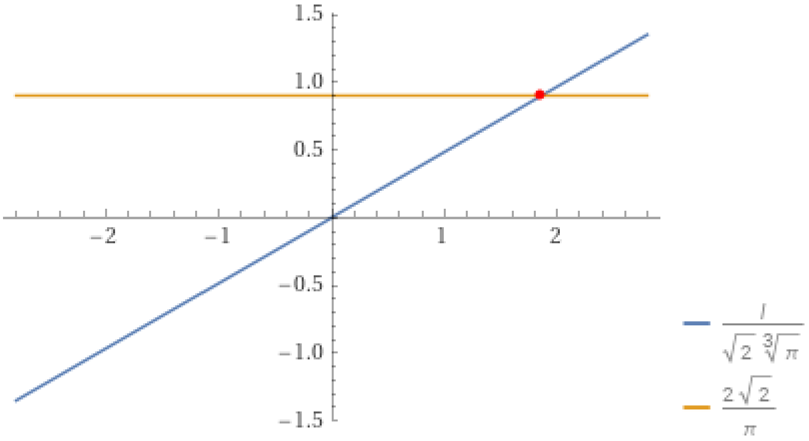
Thus, multiplying both the sides by $\sqrt[3]{2\sqrt{2}\pi}$, we obtain:

$$a = \frac{2\sqrt{2}}{\pi} \cdot \sqrt[3]{2\sqrt{2}\pi} = \sqrt[3]{\frac{\left(2\sqrt{2}\right)^3 2\sqrt{2}\pi}{\pi^3}} =$$

$$= \sqrt[3]{\frac{8\cdot\sqrt{2^3}\cdot 2\sqrt{2}}{\pi^2}} = \sqrt[3]{\frac{8\cdot\sqrt{2\cdot 2^2}\cdot 2\sqrt{2}}{\pi^2}} = \sqrt[3]{\frac{16\cdot\sqrt{2}\cdot 2\sqrt{2}}{\pi^2}}$$

$$= \sqrt[3]{\frac{32\,\sqrt{2}\sqrt{2}}{\pi^2}} = \sqrt[3]{\frac{32\;\cdot 2}{\pi^2}} = \frac{\sqrt[3]{64}}{\sqrt[3]{\pi^2}} = \frac{4}{\sqrt[3]{\pi^2}}; \; a = \frac{4}{\sqrt[3]{\pi^2}}$$

Plot



Solution

$a = \frac{4}{\sqrt[3]{\pi^2}}$

for V = 1/3*√2*a^3 (octahedron volume) and V = (4/3*π*r^3) (sphere volume), we obtain:

from the octahedron volume, we have: V = 1/3*√2*a^3 = (1/3*√2*($\frac{4}{\sqrt[3]{\pi^2}}$)^3)

(1/3*√2*(4/∛(π^2))^3)

Input

Observations

We note that, from the number 8, we obtain as follows:

8^2

64

$8^2 \times 2 \times 8$

1024

$8^4 = 8^2 \times 2^6$

True

$8^4 = 4096$

$8^2 \times 2^6 = 4096$

$2^{13} = 2 \times 8^4$

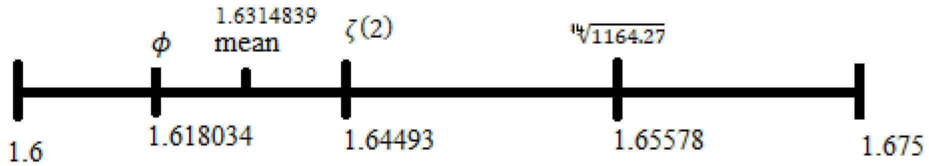
True

$2^{13} = 8192$

$2 \times 8^4 = 8192$

We notice how from the numbers 8 and 2 we get 64, 1024, 4096 and 8192, and that 8 is the fundamental number. In fact $8^2 = 64$, $8^3 = 512$, $8^4 = 4096$. We define it "fundamental number", since 8 is a Fibonacci number, which by rule, divided by the previous one, which is 5, gives 1.6 , a value that tends to the golden ratio, as for all numbers in the Fibonacci sequence

“Golden” Range

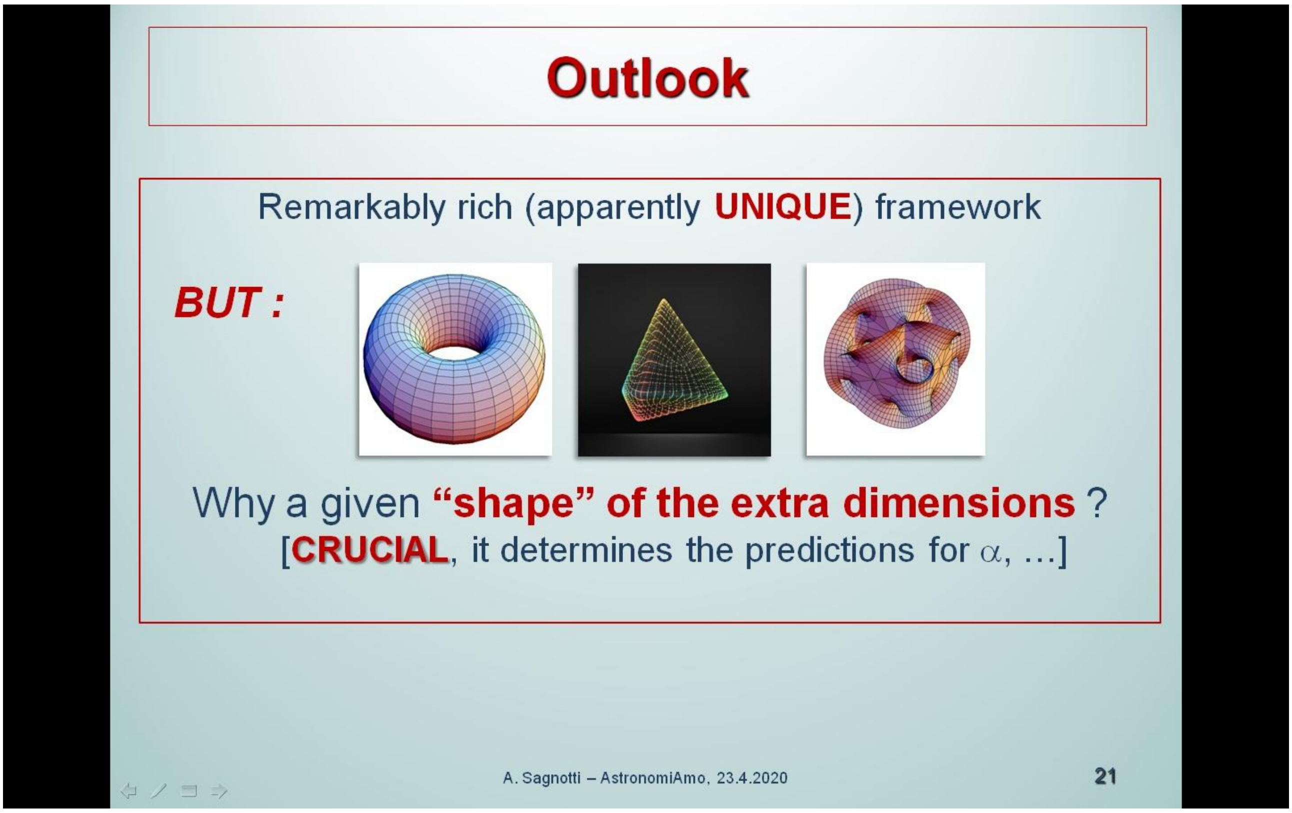


1.6314839
mean
ϕ
$\zeta(2)$
$\sqrt[14]{1164.27}$
1.6
1.618034
1.64493
1.65578
1.675

Finally we note how $8^2 = 64$, multiplied by 27, to which we add 1, is equal to 1729, the so-called "Hardy-Ramanujan number". Then taking the 15th root of 1729, we obtain a value close to $\zeta(2)$ that 1.6438 ..., which, in turn, is included in the range of what we call "golden numbers"

Furthermore for all the results very near to 1728 or 1729, adding $64 = 8^2$, one obtain values about equal to 1792 or 1793. These are values almost equal to the Planck multipole spectrum frequency 1792.35 and to the hypothetical Gluino mass

Appendix



Outlook

Remarkably rich (apparently **UNIQUE**) framework

BUT :

Why a given **“shape” of the extra dimensions** ?
[**CRUCIAL**, it determines the predictions for α, …]

A. Sagnotti – AstronomiAmo, 23.4.2020

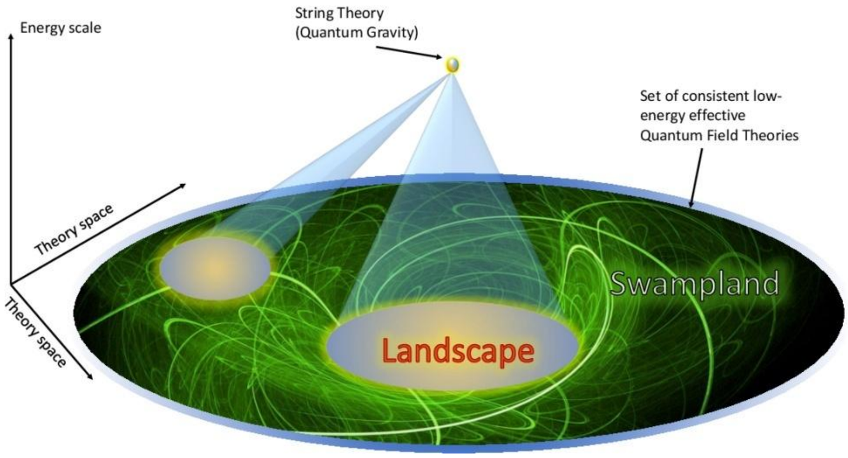
21

From: *A. Sagnotti – AstronomiAmo, 23.04.2020*

In the above figure, it is said that: “why a given shape of the extra dimensions? Crucial, it determines the predictions for α”.

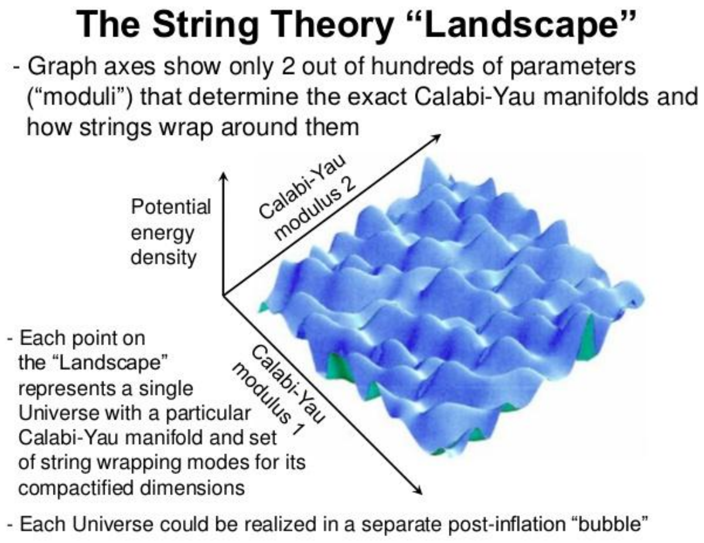
We propose that whatever shape the compactified dimensions are, their geometry must be based on the values of the golden ratio and ζ(2), (the latter connected to 1728 or 1729, whose fifteenth root provides an excellent approximation to the above mentioned value) which are recurrent as solutions of the equations that we are going to develop. It is important to specify that the initial conditions are **always** values belonging to a fundamental chapter of the work of S. Ramanujan "Modular equations and Approximations to Pi" (see references). These values are some multiples of 8 (64 and 4096), 276, which added to 4096, is equal to 4372, and finally $e^{\pi\sqrt{22}}$

We have, in certain cases, the following connections:



Energy scale
String Theory
(Quantum Gravity)
Set of consistent low-energy effective Quantum Field Theories
Theory space
Theory space
Swampland
Landscape

Fig. 1



The String Theory "Landscape"

- Graph axes show only 2 out of hundreds of parameters ("moduli") that determine the exact Calabi-Yau manifolds and how strings wrap around them
- Each point on the "Landscape" represents a single Universe with a particular Calabi-Yau manifold and set of string wrapping modes for its compactified dimensions
- Each Universe could be realized in a separate post-inflation "bubble"

Potential energy density
Calabi-Yau modulus 2
Calabi-Yau modulus 1

Fig. 2

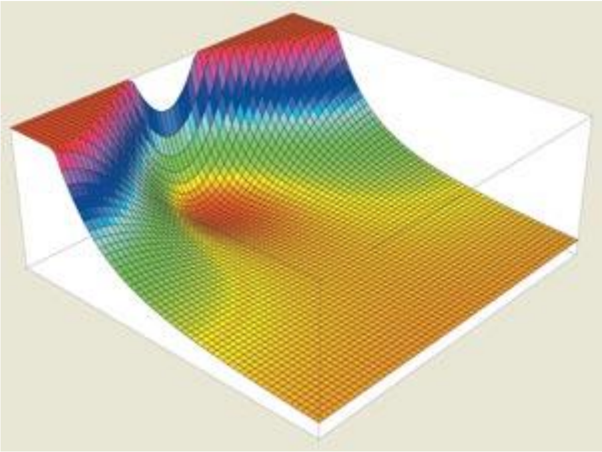


Fig. 3

Stringscape - a small part of the string-theory landscape showing the new de Sitter solution as a local minimum of the energy (vertical axis). The global minimum occurs at the infinite size of the extra dimensions on the extreme right of the figure.

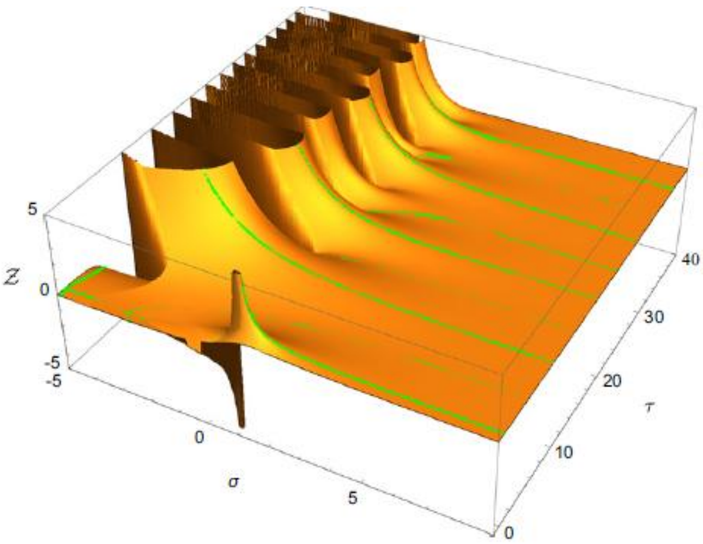

Figure 2. Lines in the complex plane where the Riemann zeta function ζ is real (green) depicted on a relief representing the positive absolute value of ζ for arguments $s \equiv \sigma + \mathrm{i}\tau$ where the real part of ζ is positive, and the negative absolute value of ζ where the real part of ζ is negative. This representation brings out most clearly that the lines of constant phase corresponding to phases of integer multiples of 2π run down the hills on the left-hand side, turn around on the right and terminate in the non-trivial zeros. This pattern repeats itself infinitely many times. The points of arrival and departure on the right-hand side of the picture are equally spaced and given by equation (11).

Fig. 4

From: https://www.mdpi.com/2227-7390/6/12/285/htm

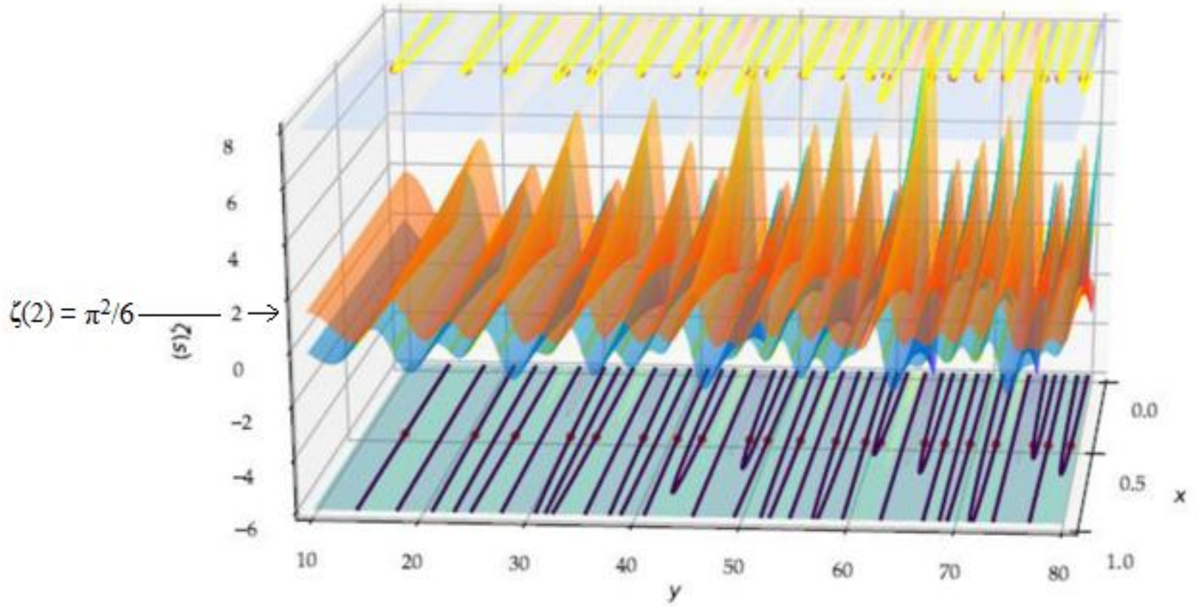

Figure 1. $C\,(x,y)$ and $S\,(x,y)$ surfaces of the Riemann $\zeta\,(x,y) = C - i\,S$ function, in the critical strip $\boldsymbol{s}$: $0 \leqslant x \leqslant 1; 10 \leqslant y \leqslant 80$. On the top and bottom planes, the C and S common zeros are the red points.

Fig. 6

Where ζ(2+it) :

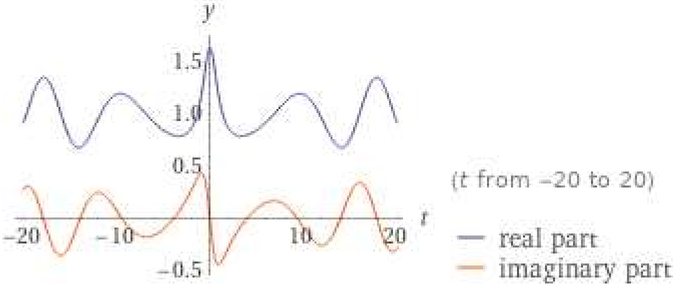
Input

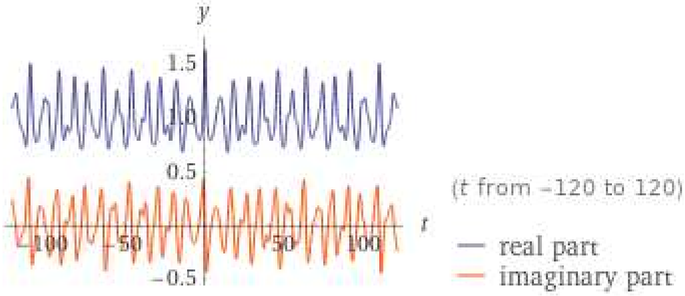
$\zeta(2 + i\, t)$

$\zeta(s)$ is the Riemann zeta function

i is the imaginary unit

Plots





Roots

$t = 2\, i\, (n + 1)\,, \quad n \in \mathbb{Z}\,, \quad n \geq 1$

$t = -i\, (\rho_n - 2)\,, \quad n \neq 0\,, \quad n \in \mathbb{Z}$

$\mathbb{Z}$ is the set of integers

ρ_n is the nontrivial n^{th} zero of the Riemann zeta function

Series expansion at t=0

$$\frac{\pi^2}{6} + i\,t\,\zeta'(2) - \frac{1}{2}t^2\,\zeta''(2) - \frac{1}{6}\,i\,\zeta^{(3)}(2)\,t^3 + \frac{1}{24}\,\zeta^{(4)}(2)\,t^4 + O\left(t^5\right)$$

(Taylor series)

Alternative representations

$$\zeta(2 + i\,t) = \zeta(2 + i\,t,\, 1)$$

.

$$\zeta(2 + i\,t) = S_{1+i\,t,1}(1)$$

.

$$\zeta(2 + i\,t) = \frac{\zeta\left(2 + i\,t,\, \frac{1}{2}\right)}{-1 + 2^{2+i\,t}}$$

$\zeta(s,\, a)$ is the generalized Riemann zeta function

$S_{n,p}(x)$ is the Nielsen generalized polylogarithm function

Series representations

$$\zeta(2 + i\,t) = \sum_{k=1}^{\infty} k^{-2-i\,t} \quad \text{for } \operatorname{Im}(t) < 1$$

.

$$\zeta(2 + i\,t) = \frac{\sum_{k=0}^{\infty} (1 + 2\,k)^{-2-i\,t}}{1 - 2^{-2-i\,t}} \quad \text{for } \operatorname{Im}(t) < 1$$

.

$$\zeta(2 + i\,t) = e^{\sum_{k=1}^{\infty} P(k\,(2+i\,t))/k} \quad \text{for } \operatorname{Im}(t) < 1$$

$\operatorname{Im}(z)$ is the imaginary part of z

$P(z)$ gives the prime zeta function

Integral representations

$$\zeta(2+i\,t) = \frac{1}{\Gamma(2+i\,t)} \int_0^\infty \frac{\tau^{1+i\,t}}{-1+e^\tau}\,d\tau \quad \text{for } \operatorname{Im}(t) < 1$$

$$\zeta(2+i\,t) = \frac{2^{1+i\,t}}{\Gamma(3+i\,t)} \int_0^\infty \tau^{2+i\,t} \operatorname{csch}^2(\tau)\,d\tau \quad \text{for } \operatorname{Im}(t) < 1$$

$$\zeta(2+i\,t) = \frac{2^{1+i\,t}}{\Gamma(2+i\,t)} \int_0^\infty e^{-\tau}\,\tau^{1+i\,t} \operatorname{csch}(\tau)\,d\tau \quad \text{for } \operatorname{Im}(t) < 1$$

$\Gamma(x)$ is the gamma function

$\operatorname{csch}(x)$ is the hyperbolic cosecant function

Functional equations

$$\zeta(2+i\,t) = -i\,2^{2+i\,t}\,\pi^{1+i\,t}\,\Gamma(-1-i\,t)\sinh\left(\frac{\pi\,t}{2}\right)\zeta(-1-i\,t)$$

$$\zeta(2+i\,t) = \frac{\pi^{3/2+i\,t}\,\Gamma\left(-\frac{1}{2}-\frac{i\,t}{2}\right)\zeta(-1-i\,t)}{\Gamma\left(1+\frac{i\,t}{2}\right)}$$

$$\zeta(2+i\,t) = -\frac{i\sum_{k=0}^{\infty}\frac{\Gamma\left(k-\frac{i\,t}{2}\right)\sum_{j=0}^{k}(-1)^j\,(1+2\,j)\binom{k}{j}\zeta(2+2\,j)}{k!}}{(-i+t)\,\Gamma\left(-\frac{i\,t}{2}\right)}$$

With regard the Fig. 4 the points of arrival and departure on the right-hand side of the picture are equally spaced and given by the following equation:

$$\tau'_k \equiv k\,\frac{\pi}{\ln 2},$$

with $k = \ldots, -2, -1, 0, 1, 2, \ldots.$

we obtain:

2Pi/(ln(2))

Input:

$$2 \times \frac{\pi}{\log(2)}$$

Exact result:

$$\frac{2\pi}{\log(2)}$$

Decimal approximation:

9.0647202836543876192553658914333336203437229354475911683720330958
...

9.06472028365….

Alternative representations:

$$\frac{2\pi}{\log(2)} = \frac{2\pi}{\log_e(2)}$$

$$\frac{2\pi}{\log(2)} = \frac{2\pi}{\log(a)\log_a(2)}$$

$$\frac{2\pi}{\log(2)} = \frac{2\pi}{2\coth^{-1}(3)}$$

Series representations:

$$\frac{2\pi}{\log(2)} = \frac{2\pi}{2 i \pi \left\lfloor \frac{\arg(2-x)}{2\pi} \right\rfloor + \log(x) - \sum_{k=1}^{\infty} \frac{(-1)^k (2-x)^k x^{-k}}{k}} \quad \text{for } x < 0$$

$$\frac{2\pi}{\log(2)} = \frac{2\pi}{\log(z_0) + \left\lfloor \frac{\arg(2-z_0)}{2\pi} \right\rfloor \left(\log\left(\frac{1}{z_0}\right) + \log(z_0)\right) - \sum_{k=1}^{\infty} \frac{(-1)^k (2-z_0)^k z_0^{-k}}{k}}$$

$$\frac{2\pi}{\log(2)} = \frac{2\pi}{2 i \pi \left\lfloor \frac{\pi - \arg\left(\frac{1}{z_0}\right) - \arg(z_0)}{2\pi} \right\rfloor + \log(z_0) - \sum_{k=1}^{\infty} \frac{(-1)^k (2-z_0)^k z_0^{-k}}{k}}$$

Integral representations:

$$\frac{2\pi}{\log(2)} = \frac{2\pi}{\int_1^2 \frac{1}{t}\, dt}$$

$$\frac{2\pi}{\log(2)} = \frac{4 i \pi^2}{\int_{-i\infty+\gamma}^{i\infty+\gamma} \frac{\Gamma(-s)^2\, \Gamma(1+s)}{\Gamma(1-s)}\, ds} \quad \text{for } -1 < \gamma < 0$$

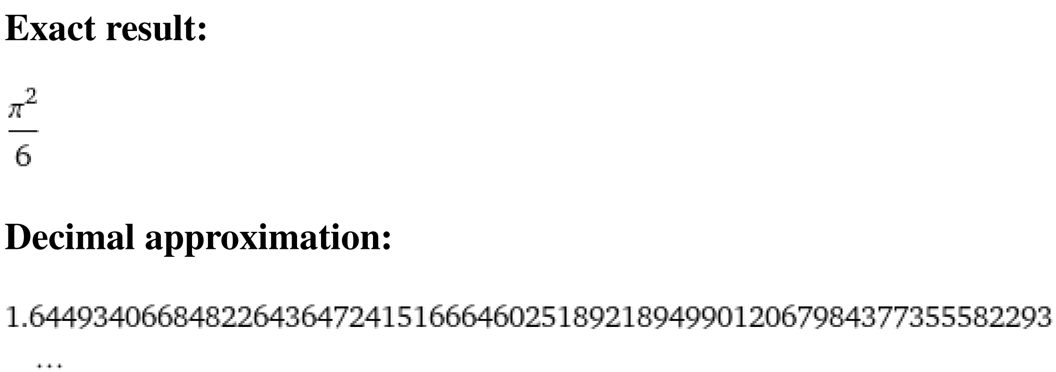
From which:

(2Pi/(ln(2)))*(1/12 π log(2))

Input:

$$\left(2 \times \frac{\pi}{\log(2)}\right)\left(\frac{1}{12}\, \pi \log(2)\right)$$

log(x) is the natural logarithm



Exact result:

$$\frac{\pi^2}{6}$$

Decimal approximation:

1.6449340668482264364724151666460251892189499012067984377355582293

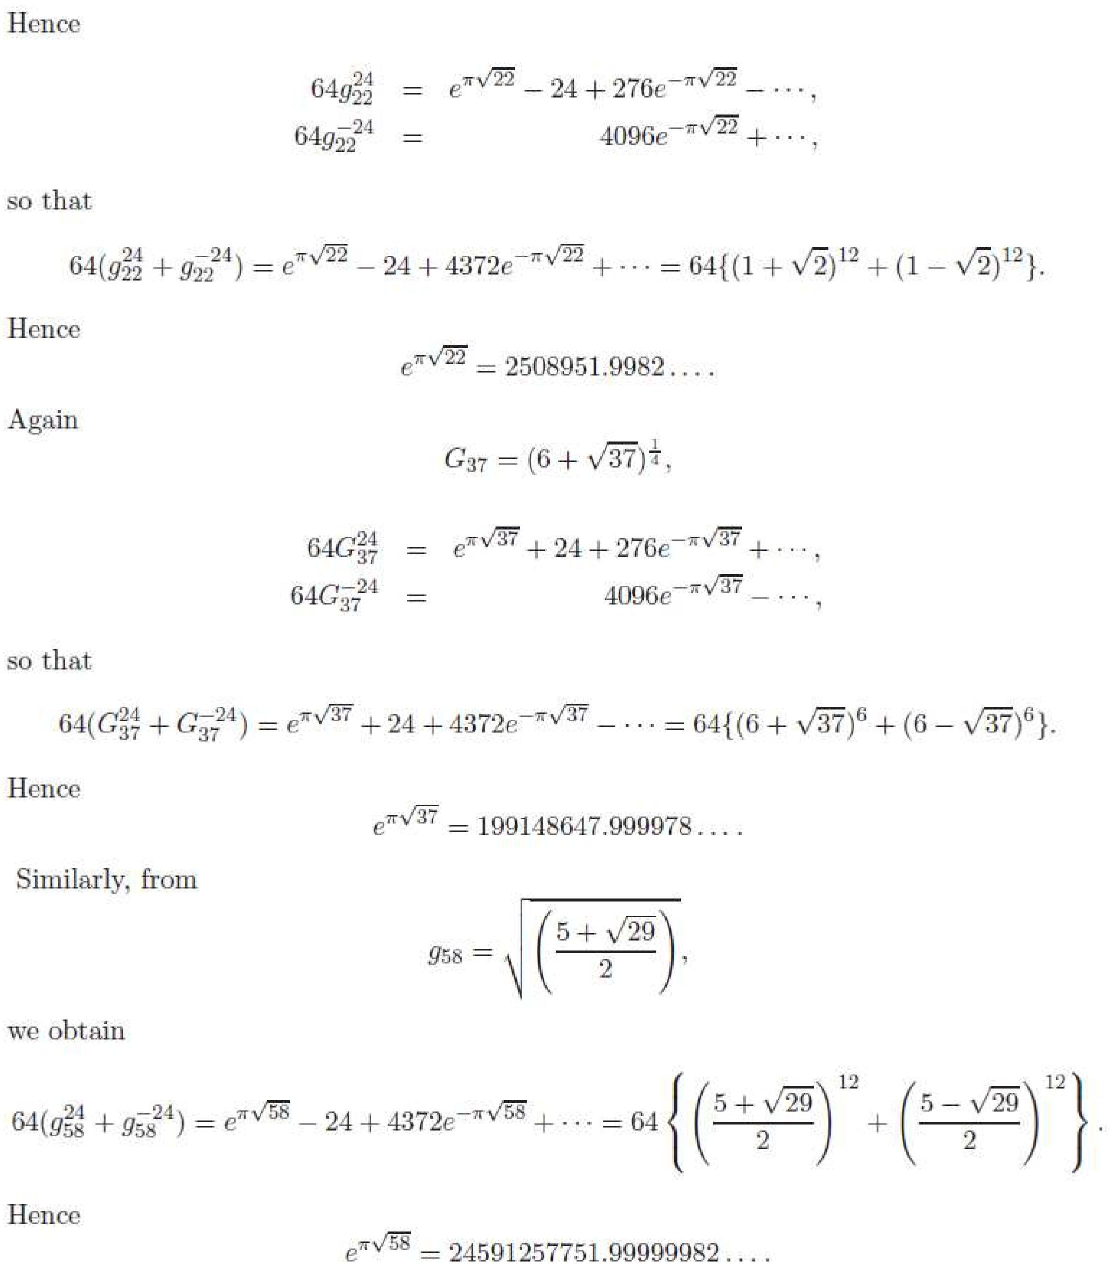
…

$1.6449340668\ldots. = \zeta(2) = \frac{\pi^2}{6} = 1.644934\ldots$

From:

Modular equations and approximations to π - *Srinivasa Ramanujan* - Quarterly Journal of Mathematics, XLV, 1914, 350 – 372

We have that:



Hence

$$\begin{aligned} 64g_{22}^{24} &= e^{\pi\sqrt{22}} - 24 + 276e^{-\pi\sqrt{22}} - \cdots, \\ 64g_{22}^{-24} &= \qquad\qquad 4096e^{-\pi\sqrt{22}} + \cdots, \end{aligned}$$

so that

$$64(g_{22}^{24} + g_{22}^{-24}) = e^{\pi\sqrt{22}} - 24 + 4372e^{-\pi\sqrt{22}} + \cdots = 64\{(1+\sqrt{2})^{12} + (1-\sqrt{2})^{12}\}.$$

Hence

$$e^{\pi\sqrt{22}} = 2508951.9982\ldots.$$

Again

$$G_{37} = (6+\sqrt{37})^{\frac{1}{4}},$$

$$\begin{aligned} 64G_{37}^{24} &= e^{\pi\sqrt{37}} + 24 + 276e^{-\pi\sqrt{37}} + \cdots, \\ 64G_{37}^{-24} &= \qquad\qquad 4096e^{-\pi\sqrt{37}} - \cdots, \end{aligned}$$

so that

$$64(G_{37}^{24} + G_{37}^{-24}) = e^{\pi\sqrt{37}} + 24 + 4372e^{-\pi\sqrt{37}} - \cdots = 64\{(6+\sqrt{37})^{6} + (6-\sqrt{37})^{6}\}.$$

Hence

$$e^{\pi\sqrt{37}} = 199148647.999978\ldots.$$

Similarly, from

$$g_{58} = \sqrt{\left(\frac{5+\sqrt{29}}{2}\right)},$$

we obtain

$$64(g_{58}^{24} + g_{58}^{-24}) = e^{\pi\sqrt{58}} - 24 + 4372e^{-\pi\sqrt{58}} + \cdots = 64\left\{\left(\frac{5+\sqrt{29}}{2}\right)^{12} + \left(\frac{5-\sqrt{29}}{2}\right)^{12}\right\}.$$

Hence

$$e^{\pi\sqrt{58}} = 24591257751.99999982\ldots.$$

We note that, with regard 4372, we can to obtain the following results:

27((4372)^1/2-2-1/2(((√(10-2√5) -2))/((√5-1))))+φ

Input

$$27\left(\sqrt{4372}-2-\frac{1}{2}\times\frac{\sqrt{10-2\sqrt{5}}-2}{\sqrt{5}-1}\right)+\phi$$

ϕ is the golden ratio

Result

$$\phi+27\left(-2+2\sqrt{1093}-\frac{\sqrt{10-2\sqrt{5}}-2}{2\left(\sqrt{5}-1\right)}\right)$$

Decimal approximation

1729.0526944170905625170637208637148763684189306538457854815447023...

1729.0526944….

This result is very near to the mass of candidate glueball **f_0(1710) scalar meson.** Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve. (1728 = $8^2 * 3^3$) The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number)

Alternate forms

Integral representation

$$(1+z)^{a}=\frac{\int_{-i\infty+\gamma}^{i\infty+\gamma}\frac{\Gamma(s)\Gamma(-a-s)}{z^{s}}\,ds}{(2\pi i)\Gamma(-a)}$$ for ($0<\gamma<-\operatorname{Re}(a)$ and $|\arg(z)|<\pi$)

From:

An Update on Brane Supersymmetry Breaking - *J. Mourad and A. Sagnotti* - arXiv:1711.11494v1 [hep-th] 30 Nov 2017

From the following vacuum equations:

$$T\, e^{\gamma_E\, \phi} \;=\; -\,\frac{\beta_E^{(p)}\, h^2}{\gamma_E}\, e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}$$

$$16\, k'\, e^{-2C} \;=\; \frac{h^2\left(p\,+\,1\,-\,\frac{2\,\beta_E^{(p)}}{\gamma_E}\right) e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}}{(7\,-\,p)}$$

$$(A')^2 \;=\; k\, e^{-2\,A} \,+\, \frac{h^2}{16(p\,+\,1)}\left(7\,-\,p\,+\,\frac{2\,\beta_E^{(p)}}{\gamma_E}\right) e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}$$

we have obtained, from the results almost equals of the equations, putting

$4096\, e^{-\pi\sqrt{18}}$ instead of

$$e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}$$

a new possible mathematical connection between the two exponentials. Thence, also the values concerning p, C, β_E and ϕ correspond to the exponents of e (i.e. of exp). Thence we obtain for p = 5 and $\beta_E = 1/2$:

$$e^{-6C+\phi} = 4096e^{-\pi\sqrt{18}}$$

Therefore, with respect to the exponentials of the vacuum equations, the Ramanujan's exponential has a coefficient of 4096 which is equal to 64^2, while $-6C+\phi$ is equal to $-\pi\sqrt{18}$. From this it follows that it is possible to establish mathematically, the dilaton value.

For

exp((-Pi*sqrt(18)) we obtain:

Input:

$$\exp\left(-\pi\sqrt{18}\right)$$

Exact result:

$$e^{-3\sqrt{2}\,\pi}$$

Decimal approximation:

$$1.6272016226072509292942156739117979541838581136954016\ldots \times 10^{-6}$$

$1.6272016\ldots * 10^{-6}$

Property:

$e^{-3\sqrt{2}\,\pi}$ is a transcendental number

Series representations:

$$e^{-\pi\sqrt{18}} = e^{-\pi\sqrt{17}\sum_{k=0}^{\infty}17^{-k}\binom{1/2}{k}}$$

$$e^{-\pi\sqrt{18}} = \exp\left(-\pi\sqrt{17}\sum_{k=0}^{\infty}\frac{\left(-\frac{1}{17}\right)^k\left(-\frac{1}{2}\right)_k}{k!}\right)$$

$$e^{-\pi \sqrt{18}} = \exp\left(-\frac{\pi \sum_{j=0}^{\infty} \operatorname{Res}_{s=-\frac{1}{2}+j} 17^{-s} \Gamma\left(-\frac{1}{2} - s\right) \Gamma(s)}{2 \sqrt{\pi}} \right)$$

Now, we have the following calculations:

$$e^{-6C+\phi} = 4096 e^{-\pi\sqrt{18}}$$

$$e^{-\pi\sqrt{18}} = 1.6272016\ldots * 10^{-6}$$

from which:

$$\frac{1}{4096} e^{-6C+\phi} = 1.6272016\ldots * 10^{-6}$$

$$0.000244140625\, e^{-6C+\phi} = e^{-\pi\sqrt{18}} = 1.6272016\ldots * 10^{-6}$$

Now:

$$\ln\left(e^{-\pi\sqrt{18}}\right) = -13.328648814475 = -\pi\sqrt{18}$$

And:

(1.6272016* 10^-6) *1/ (0.000244140625)

Input interpretation:

$$\frac{1.6272016}{10^6} \times \frac{1}{0.000244140625}$$

Result:

0.0066650177536

0.006665017...

Thence:

$$0.000244140625\, e^{-6C+\phi} = e^{-\pi\sqrt{18}}$$

Dividing both sides by 0.000244140625, we obtain:

$$\frac{0.000244140625}{0.000244140625} e^{-6C+\phi} = \frac{1}{0.000244140625} e^{-\pi\sqrt{18}}$$

$$e^{-6C+\phi} = 0.0066650177536$$

((((exp((-Pi*sqrt(18)))))))*1/0.000244140625

Input interpretation:

$$\exp\left(-\pi\sqrt{18}\right) \times \frac{1}{0.000244140625}$$

Result:

0.00666501785...

0.00666501785…

Series representations:

$$\frac{\exp(-\pi\sqrt{18})}{0.000244141} = 4096 \exp\left(-\pi \sqrt{17} \sum_{k=0}^{\infty} 17^{-k} \binom{\frac{1}{2}}{k}\right)$$

$$\frac{\exp(-\pi\sqrt{18})}{0.000244141} = 4096 \exp\left(-\pi \sqrt{17} \sum_{k=0}^{\infty} \frac{\left(-\frac{1}{17}\right)^k \left(-\frac{1}{2}\right)_k}{k!}\right)$$

$$\frac{\exp(-\pi\sqrt{18})}{0.000244141} = 4096 \exp\left(-\frac{\pi \sum_{j=0}^{\infty} \operatorname{Res}_{s=-\frac{1}{2}+j} 17^{-s} \,\Gamma\left(-\frac{1}{2}-s\right)\Gamma(s)}{2\sqrt{\pi}}\right)$$

Now:

$$e^{-6C+\phi} = 0.0066650177536$$

$$\exp\left(-\pi\sqrt{18}\right) \times \frac{1}{0.000244140625} =$$

$$e^{-\pi\sqrt{18}} \times \frac{1}{0.000244140625}$$

$$= 0.00666501785\ldots$$

From:

ln(0.00666501784619)

Input interpretation:

$$\log(0.006665017846190000) = -\text{Li}_1(0.993334982153810000)$$

Series representations:

$$\log(0.006665017846190000) = -\sum_{k=1}^{\infty} \frac{(-1)^k (-0.993334982153810000)^k}{k}$$

$$\log(0.006665017846190000) = 2 i \pi \left\lfloor \frac{\arg(0.006665017846190000 - x)}{2 \pi} \right\rfloor + \log(x) - \sum_{k=1}^{\infty} \frac{(-1)^k (0.006665017846190000 - x)^k x^{-k}}{k} \quad \text{for } x < 0$$

$$\log(0.006665017846190000) = \left\lfloor \frac{\arg(0.006665017846190000 - z_0)}{2\pi} \right\rfloor \log\left(\frac{1}{z_0}\right) + \log(z_0) + \left\lfloor \frac{\arg(0.006665017846190000 - z_0)}{2\pi} \right\rfloor \log(z_0) - \sum_{k=1}^{\infty} \frac{(-1)^k (0.006665017846190000 - z_0)^k z_0^{-k}}{k}$$

Integral representation:

$$\log(0.006665017846190000) = \int_1^{0.006665017846190000} \frac{1}{t}\, dt$$

In conclusion:

$$-6C + \phi = -5.010882647757\ldots$$

and for C = 1, we obtain:

$$\phi = -5.010882647757 + 6 = 0.989117352243 = \boldsymbol{\phi}$$

Note that the values of n_s (spectral index) 0.965, of the average of the Omega mesons Regge slope 0.987428571 and of the dilaton 0.989117352243, are also connected to the following two Rogers-Ramanujan continued fractions:

$$\frac{e^{-\frac{\pi}{5}}}{\sqrt{(\varphi-1)\sqrt{5}} - \varphi + 1} = 1 - \cfrac{e^{-\pi}}{1 + \cfrac{e^{-2\pi}}{1 + \cfrac{e^{-3\pi}}{1 + \cfrac{e^{-4\pi}}{1 + \ldots}}}} \approx 0.9568666373$$

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\cfrac{e^{-\pi\sqrt{5}}}{1+\cfrac{e^{-2\pi\sqrt{5}}}{1+\cfrac{e^{-3\pi\sqrt{5}}}{1+\cfrac{e^{-4\pi\sqrt{5}}}{1+\dots}}}}\approx 0.9991104684$$

(http://www.bitman.name/math/article/102/109/)

Also performing the 512th root of the inverse value of the Pion meson rest mass 139.57, we obtain:

((1/(139.57)))^1/512

Input interpretation:

$$\sqrt[512]{\frac{1}{139.57}}$$

Result:

0.990400732708644027550973755713301415460732796178555551684...

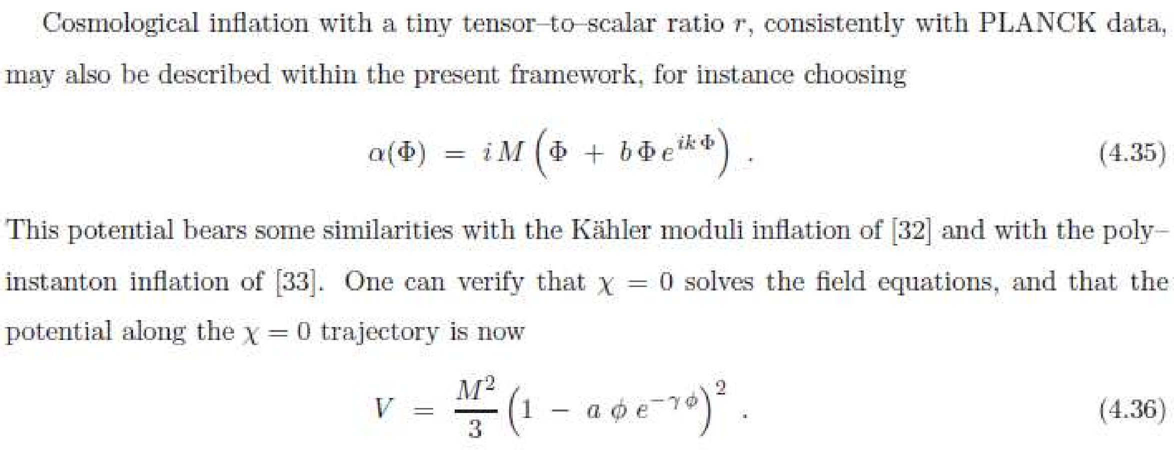
0.99040073.... result very near to the dilaton value 0.989117352243 = ***ϕ*** and to the value of the following Rogers-Ramanujan continued fraction:

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\cfrac{e^{-\pi\sqrt{5}}}{1+\cfrac{e^{-2\pi\sqrt{5}}}{1+\cfrac{e^{-3\pi\sqrt{5}}}{1+\cfrac{e^{-4\pi\sqrt{5}}}{1+\dots}}}}\approx 0.9991104684$$

From

Properties of Nilpotent Supergravity - *E. Dudas, S. Ferrara, A. Kehagias and A. Sagnotti* - arXiv:1507.07842v2 [hep-th] 14 Sep 2015

We have that:



Cosmological inflation with a tiny tensor–to–scalar ratio r, consistently with PLANCK data, may also be described within the present framework, for instance choosing

$$\alpha(\Phi) \;=\; i\,M\left(\Phi \;+\; b\,\Phi\,e^{ik\Phi}\right)\;. \tag{4.35}$$

This potential bears some similarities with the Kähler moduli inflation of [32] and with the poly–instanton inflation of [33]. One can verify that $\chi\;=\;0$ solves the field equations, and that the potential along the $\chi=0$ trajectory is now

$$V \;=\; \frac{M^2}{3}\left(1\;-\;a\,\phi\,e^{-\gamma\,\phi}\right)^2\;. \tag{4.36}$$

We analyzing the following equation:

$$V \;=\; \frac{M^2}{3}\left(1\;-\;a\,\phi\,e^{-\gamma\,\phi}\right)^2\;.$$

$$\phi \;=\; \varphi \;-\; \frac{\sqrt{6}}{k}\;,$$

$$a \;=\; \frac{b\,\gamma}{e}\;<\;0\;, \qquad \gamma\;=\;\frac{k}{\sqrt{6}}\;<\;0\;.$$

We have:

(M^2)/3*[1-(b/euler number * k/sqrt6) * (φ- sqrt6/k) * exp(-(k/sqrt6)(φ- sqrt6/k))]^2

i.e.

V = (M^2)/3*[1-(b/euler number * k/sqrt6) * (φ- sqrt6/k) * exp(-(k/sqrt6)(φ- sqrt6/k))]^2

For k = 2 and φ = 0.9991104684, that is the value of the scalar field that is equal to the value of the following Rogers-Ramanujan continued fraction:

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\frac{e^{-\pi\sqrt{5}}}{1+\frac{e^{-2\pi\sqrt{5}}}{1+\frac{e^{-3\pi\sqrt{5}}}{1+\frac{e^{-4\pi\sqrt{5}}}{1+\ldots}}}}\approx 0.9991104684$$

we obtain:

V = (M^2)/3*[1-(b/euler number * 2/sqrt6) * (0.9991104684- sqrt6/2) * exp(-(2/sqrt6)(0.9991104684- sqrt6/2))]^2

Input interpretation:

$$V = \frac{M^2}{3}\left(1-\left(\frac{b}{e}\times\frac{2}{\sqrt{6}}\right)\left(0.9991104684-\frac{\sqrt{6}}{2}\right)\exp\left(-\frac{2}{\sqrt{6}}\left(0.9991104684-\frac{\sqrt{6}}{2}\right)\right)\right)^2$$

Result:

$$V = \frac{1}{3}(0.0814845\,b+1)^2 M^2$$

Solutions:

$$b = \frac{225.913\left(-0.054323\,M^2 \pm 6.58545\times 10^{-10}\sqrt{M^4}\right)}{M^2} \quad (M \neq 0)$$

Alternate forms:

$$V = 0.00221324\,(b + 12.2723)^2\,M^2$$

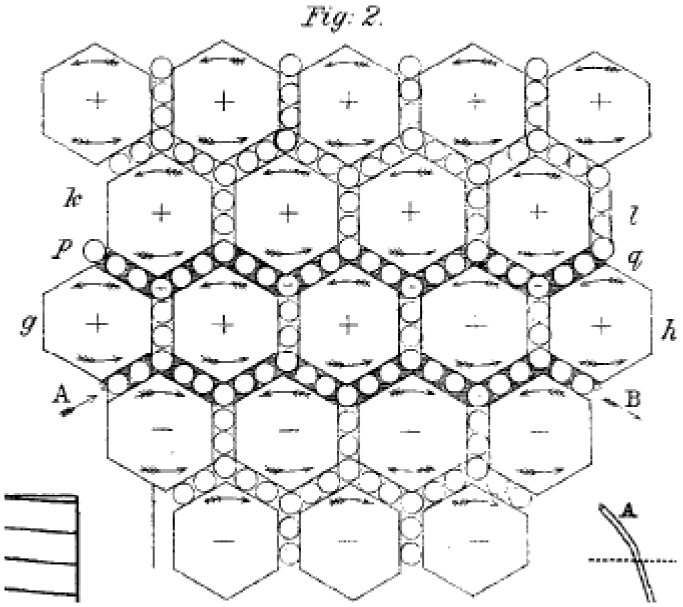
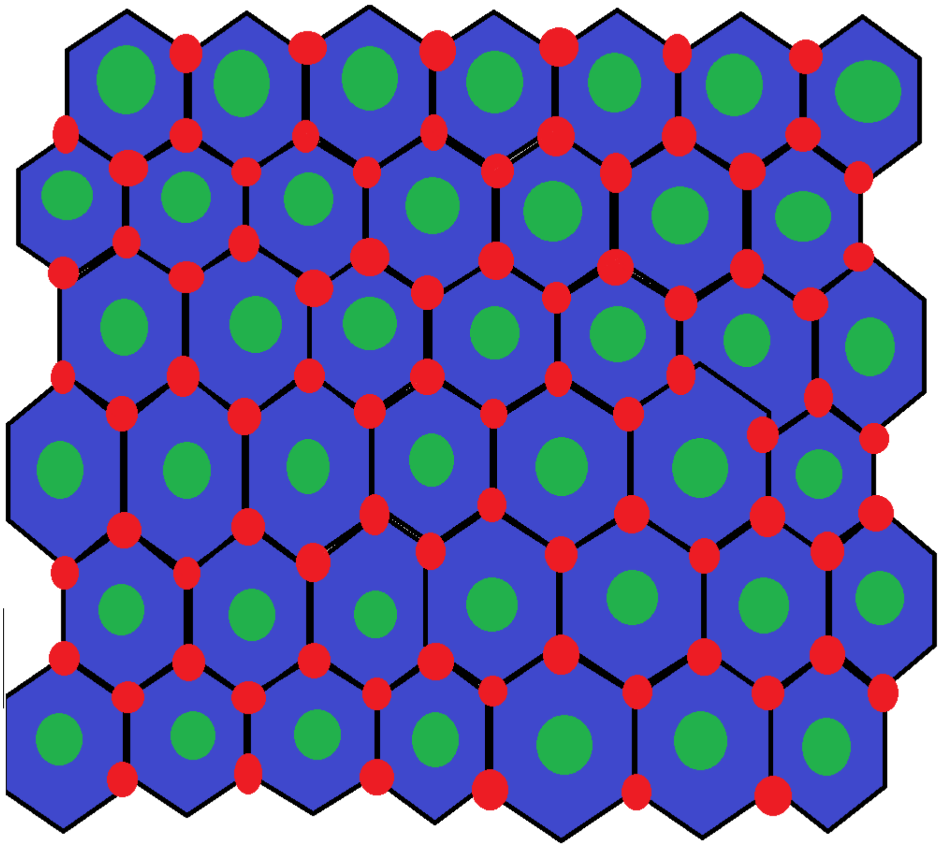
Fig. 1



It is therefore possible to consider the vortices of the "quantum vacuum" schematized as cubes or octahedrons (the + sign inside a given vortex indicates its counterclockwise rotation, while the - sign indicates its clockwise rotation). Between vortex and vortex there is a layer of "bubbles"-universes (or universes-spheres), which flows, as in the simplified two-dimensional drawing, from A to B

Fig. 2

Immagine dello Spazio-Tempo a scala quantistica: le cironferenze in rosso rappresentano i punti corrispondenti alle dimensioni compattificate e gli esagoni in blu, rappresentano le “fluttuazioni” (universi potenziali – cerchi verdi) del vuoto quantistico (2D)



Proposal

Image of space-time at quantum scale: the circles in red represent the points corresponding to the compactified dimensions and the hexagons in blue, represent the "fluctuations" (potential universes - green circles) of the quantum vacuum (2D). In reality, we will have n-dimensional hyperspheres in which the compactified dimensions "roll up" and octahedrons representing the "fluctuations", containing spheres (bubbles of potential universes), of the quantum vacuum

Acknowledgments

We would like to thank Professor **Augusto Sagnotti** theoretical physicist at Scuola Normale Superiore (Pisa – Italy) for his very useful explanations and his availability.

Analyzing some equations of Manuscript Book 2 of Srinivasa Ramanujan. New possible mathematical connections with several equations concerning the Geometric Measure Theory, the MRB Constant and various sectors of String Theory

Michele Nardelli[1], **Antonio Nardelli**

Abstract

In this paper, we analyze some equations of Manuscript Book 2 of Srinivasa Ramanujan. We describe the new possible mathematical connections with several equations concerning the Geometric Measure Theory, the MRB (Marvin Ray Burns) Constant and various sectors of String Theory

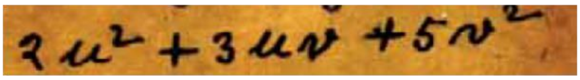
Manuscript Book 2 – *by Srinivasa Ramanujan*

We have the following equation:



$2u^2 + 3uv + 5v^2$

2u^2 + 3uv + 5v^2

Input

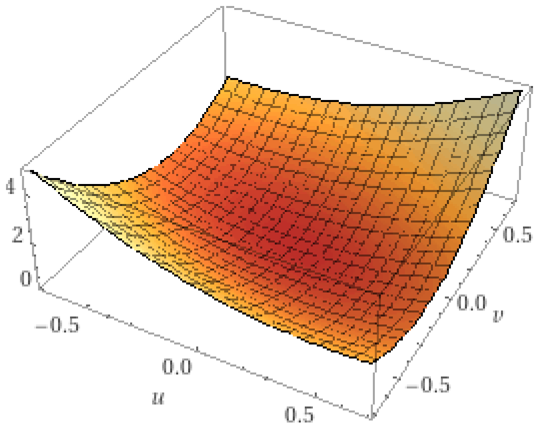
$2u^2 + 3uv + 5v^2$

Geometric figure

elliptic paraboloid

3D plot **(figure that can be related to a D-brane/Instanton)**

The key observation from the below plots and is that at $u = 1$, which is taken as the energy density of the universe at the Big Bang, with $v = 0$ the zero spacetime volume, the vacuum geometry brakes / or there is symmetry breaking on the vacuum quantum geometry. We see from the plots as the vacuum spacetime break/tear apart.



Contour plot

For y = 71.8

From:

$$\frac{1}{448}\left(112\sqrt{31}\sqrt{-y^2}-336\,y\right)$$

we obtain:

1/448(112sqrt(31)*sqrt((-71.8)^2)-336*71.8)

Input:

$$\frac{1}{448}\left(112\sqrt{31}\sqrt{(-71.8)^2}-336\times 71.8\right)$$

Result

46.0914…

46.0914....

For y = 502.3

from

$$\frac{1}{448}\left(112\sqrt{31}\sqrt{-y^2}-336\,y\right)$$

we obtain:

1/448(112sqrt(31)*sqrt((-502.3)^2)-336*502.3)

Input

$$\frac{1}{448}\left(112\sqrt{31}\sqrt{(-502.3)^2}-336\times 502.3\right)$$

Result

322.447...

322.447...

From the difference between the two above expressions, after some calculations, we obtain:

16((((1/448(112sqrt(31)*sqrt((-502.3)^2)-336*502.3) - 1/448(112sqrt(31)*sqrt((-71.8)^2)-336*71.8)))))-276-55+5+2*MRB const

Input

$$16\left(\frac{1}{448}\left(112\sqrt{31}\sqrt{(-502.3)^2}-336\times 502.3\right)-\frac{1}{448}\left(112\sqrt{31}\sqrt{(-71.8)^2}-336\times 71.8\right)\right)-276-55+5+2C_{\mathrm{MRB}}$$

C_{MRB} is the MRB constant

Result

4096.07...

4096.07.... ≈ 4096

The number 4096 = 64^2, is the Ramanujan Recurring Number, that when multiplied by 2 give 8192. The total amplitude vanishes for gauge group SO(8192) for bosonic string SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). This could be the implications for a pre-big bang scenario where only self-perturbative bosonic strings lived when the enthalpy was extremely low as discussed above.

This regime contains all the intrinsic properties of superstrings inherent in the bosonic strings, would at the big bang give effect to the properties of matter (fermions) as Higgs Boson. This number theoretic connection to the gauge group SO(8192), gives a much more compelling relevance of the bosonic string theory SO(8192), to quantum gravity and places this string theory where it should appropriately be in the evolution of the universe from a quantum gravity perspective rather than it be neglected because it doesn't include fermionic strings to confirm to post big-bang reality. The vanishing of the bosonic string's amplitude could be explained by the effect of extreme low entropy on the quantum vacuum geometry. Thus, as the entropy increases infinitesimally as a result of the vacuum self-perturbation then also is the amplitude of the vibrating bosonic strings from zero. Thus, was right to indicate that the "vanishing of the amplitude of the bosonic string could be the results of string theory itself", but here, we give a much more elaborate explanation of what could be happening.

27sqrt(16((((1/448(112sqrt(31)*sqrt((-502.3)^2)-336*502.3) - 1/448(112sqrt(31)*sqrt((-71.8)^2)-336*71.8)))))-276-55+5+2*MRB const)+1

$$27\sqrt{\left(16\left(\frac{1}{448}\left(112\sqrt{31}\sqrt{(-502.3)^2}-336\times502.3\right)-\frac{1}{448}\left(112\sqrt{31}\sqrt{(-71.8)^2}-336\times71.8\right)\right)-276-55+5+2C_{\mathrm{MRB}}\right)}+1$$

C_{MRB} is the MRB constant

Result

1729.01…

1729.01

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve $1728 = 8^2 \times 3^3$. The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways $10^3 + 9^3 = 12^3 + 1^3 = 1729$ and Ramanujan's recurring number). Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string. Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron. As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string. That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2. Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after? That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

((27sqrt(16((((1/448(112sqrt(31)*sqrt((-502.3)^2)-336*502.3) - 1/448(112sqrt(31)*sqrt((-71.8)^2)-336*71.8))))))-276-55+5+2*MRB const)+1))^1/15

The number 4096 = 64^2, is the Ramanujan Recurring Number, that when multiplied by 2 give 8192. The total amplitude vanishes for gauge group SO(8192) for bosonic string SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). This could be the implications for a pre-big bang scenario where only self-perturbative bosonic strings lived when the enthalpy was extremely low as discussed above. This regime contains all the intrinsic properties of superstrings inherent in the bosonic strings, would at the big bang give effect to the properties of matter (fermions) as Higgs Boson. This number theoretic connection to the gauge group SO(8192), gives a much more compelling relevance of the bosonic string theory SO(8192), to quantum gravity and places this string theory where it should appropriately be in the evolution of the universe from a quantum gravity perspective rather than it be neglected because it doesn't include fermionic strings to confirm to post big-bang reality. The vanishing of the bosonic string's amplitude could be explained by the effect of extreme low entropy on the quantum vacuum geometry. Thus, as the entropy increases infinitesimally as a result of the vacuum self-perturbation then also is the amplitude of the vibrating bosonic strings from zero. Thus, was right to indicate that the "vanishing of the amplitude of the bosonic string could be the results of string theory itself", but here, we give a much more elaborate explanation of what could be happening.

27sqrt((1/4(ln(((((9.43892 e^(-π 0.8^2) 0.8)/(-1 + e^(2 π 0.8)))) *1/ (((9.43892 e^(-π 8^2) 8)/(-1 + e^(2 π 8))))))+13+φ-Φ+1/2*MRB const))^2-e-MRB const)+1

Result

1728.982…

1728.92

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve $1728 = 8^2 \times 3^3$. The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways $10^3 + 9^3 = 12^3 + 1^3 = 1729$ and Ramanujan's recurring number). Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string. Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron. As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string.

That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2. Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after? That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

$$\left(\frac{1}{27}\left(\left(0.0846582\left((3-6\pi\times 4)\operatorname{Li}_2\left(e^{2\pi\times 4}\right)+3\operatorname{Li}_3\left(e^{2\pi\times 4}\right)+\frac{2\pi^2\left(e^{2\pi\times 4}(2\pi\times 4-3)-2\pi\times 4\right)\times 4^2}{e^{2\pi\times 4}-1}-6\pi(\pi\times 2-1)\times 4\log\left(1-e^{2\pi\times 4}\right)\right)+728-13+\Phi\right)-1\right)\right)^2-C_{\text{MRB}}$$

$\operatorname{Li}_n(x)$ is the polylogarithm function

$\log(x)$ is the natural logarithm

Φ is the golden ratio conjugate

C_{MRB} is the MRB constant

Result

$4052.39\ldots +$
$595.739\ldots i$

Alternate complex forms

$4095.95(\cos(0.145964) + i\sin(0.145964))$

$4095.95\, e^{0.145964\, i}$

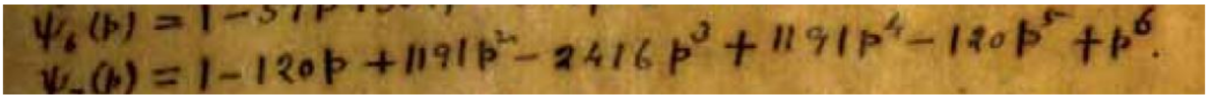
Polar coordinates

$r = 4095.95$ (radius), $\theta = 0.145964$ (angle)

$4095.95 \approx 4096$

The number 4096 = 64^2, is the Ramanujan Recurring Number, that when multiplied by 2 give 8192. The total amplitude vanishes for gauge group SO(8192) for bosonic string SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). This could be the implications for a pre-big bang scenario where only self-perturbative bosonic strings lived when the enthalpy was extremely low as discussed above. This regime contains all the intrinsic properties of superstrings inherent in the bosonic strings, would at the big bang give effect to the properties of matter (fermions) as Higgs Boson. This number theoretic connection to the gauge group SO(8192), gives a much more compelling relevance of the bosonic string theory SO(8192), to quantum gravity and places this string theory where it should appropriately be in the evolution of the universe from a quantum gravity perspective rather than it be neglected because it doesn't include fermionic strings to confirm to post big-bang reality. The vanishing of the bosonic string's amplitude could be explained by the effect of extreme low entropy on the quantum vacuum geometry. Thus, as the entropy increases infinitesimally as a result of the vacuum self-perturbation then also is the amplitude of the vibrating bosonic strings from zero. Thus, was right to indicate that the "vanishing of the amplitude of the bosonic string could be the results of string theory itself", but here, we give a much more elaborate explanation of what could be happening.

From



$\psi_6(p) = 1 - 5$

$\psi(p) = 1 - 120p + 1191p^2 - 2416p^3 + 1191p^4 - 120p^5 + p^6.$

We consider:

1-120*p + 1191*p^2 – 2416*p^3 + 1191*p^4 – 120*p^5 + p^6

Input

$1 - 120\,p + 1191\,p^2 - 2416\,p^3 + 1191\,p^4 - 120\,p^5 + p^6$

1728.986248565….

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve $1728 = 8^2 \times 3^3$. The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways $10^3 + 9^3 = 12^3 + 1^3 = 1729$ and Ramanujan's recurring number). Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string. Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron. As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string. That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2. Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after? That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

Alternate forms

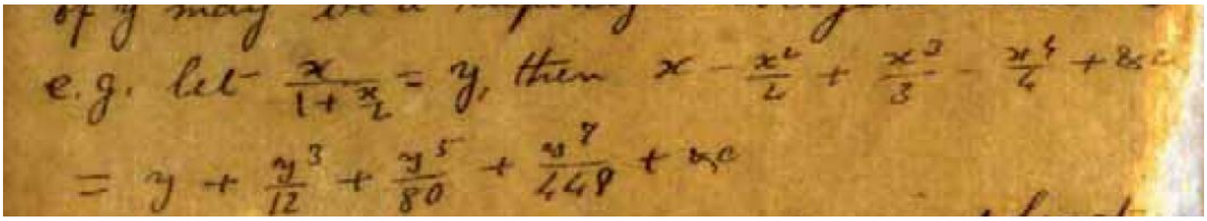
$$C_{\mathrm{MRB}}{}^{1-1/(4\pi)+\pi}+\sqrt[15]{\frac{1}{35}\left(60\,531-35\sqrt{2\pi}\,C_{\mathrm{MRB}}\right)}$$

$$\frac{1}{35}C_{\mathrm{MRB}}{}^{-1/(4\pi)}\left(35\,C_{\mathrm{MRB}}{}^{1+\pi}+35^{14/15}\sqrt[4\pi]{C_{\mathrm{MRB}}}\ \sqrt[15]{60\,531-35\sqrt{2\pi}\,C_{\mathrm{MRB}}}\right)$$

Now, we analyze the following equation:



e.g. let $\frac{x}{1+\frac{x}{2}} = y$, then $x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \&c$

$= y + \frac{y^3}{12} + \frac{y^5}{80} + \frac{y^7}{448} + \&c$

x- 1/2*x^2 + 1/3*x^3 – 1/4*x^4 = y + 1/12*y^3 + 1/80*y^5 + 1/448*y^8

we consider:

x- 1/2*x^2 + 1/3*x^3 – 1/4*x^4 - (y + 1/12*y^3 + 1/80*y^5 + 1/448*y^8)

Input

$$x - \frac{1}{2}x^2 + \frac{1}{3}x^3 - \frac{1}{4}x^4 - \left(y + \frac{1}{12}y^3 + \frac{1}{80}y^5 + \frac{1}{448}y^8\right)$$

Result

$$-\frac{x^4}{4} + \frac{x^3}{3} - \frac{x^2}{2} + x - \frac{y^8}{448} - \frac{y^5}{80} - \frac{y^3}{12} - y$$

3D plot (figure that can be related to a D-brane/Instanton)

The key observation from the below plots and is that at $x = 1$, which is taken as the energy density of the universe at the Big Bang, with $y = 0$ the zero spacetime volume, the vacuum geometry brakes / or there is symmetry breaking on the vacuum quantum geometry. We see from the plots as the vacuum spacetime break/tear apart.

Repeating decimal

$1729.0\overline{6}$ (period 1)

1729.06

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve $1728 = 8^2 \times 3^3$. The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways $10^3 + 9^3 = 12^3 + 1^3 = 1729$ and Ramanujan's recurring number). Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string. Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron. As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string. That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2. Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after? That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

...

4095.997745593…. ≈ 4096

The number 4096 = 64^2, is the Ramanujan Recurring Number, that when multiplied by 2 give 8192. The total amplitude vanishes for gauge group SO(8192) for bosonic string SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). This could be the implications for a pre-big bang scenario where only self-perturbative bosonic strings lived when the enthalpy was extremely low as discussed above. This regime contains all the intrinsic properties of superstrings inherent in the bosonic strings, would at the big bang give effect to the properties of matter (fermions) as Higgs Boson. This number theoretic connection to the gauge group SO(8192), gives a much more compelling relevance of the bosonic string theory SO(8192), to quantum gravity and places this string theory where it should appropriately be in the evolution of the universe from a quantum gravity perspective rather than it be neglected because it doesn't include fermionic strings to confirm to post big-bang reality. The vanishing of the bosonic string's amplitude could be explained by the effect of extreme low entropy on the quantum vacuum geometry.

Thus, as the entropy increases infinitesimally as a result of the vacuum self-perturbation then also is the amplitude of the vibrating bosonic strings from zero. Thus, was right to indicate that the "vanishing of the amplitude of the bosonic string could be the results of string theory itself", but here, we give a much more elaborate explanation of what could be happening.

From

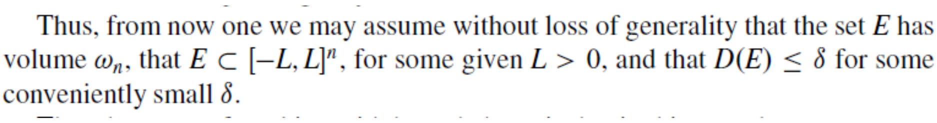
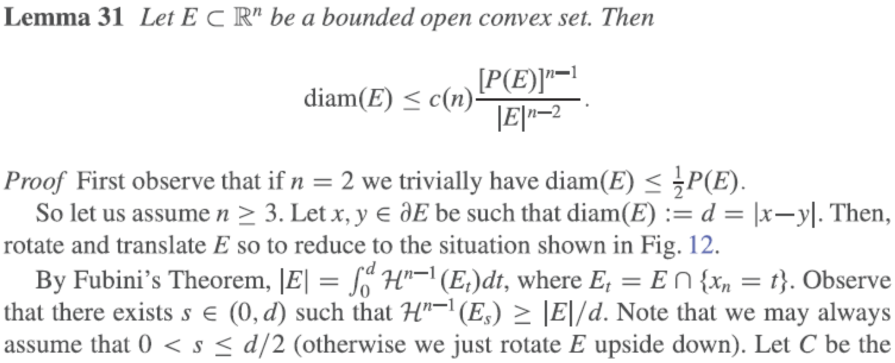
Vector-Valued Partial Differential Equations and Applications - *Bernard Dacorogna, Nicola Fusco, Stefan Mruller, Vladimir Sverak* - Cetraro, Italy 2013

The Stability of the Isoperimetric Inequality - *Nicola Fusco*

We have:



Thus, from now one we may assume without loss of generality that the set E has volume ω_n, that $E \subset [-L, L]^n$, for some given $L > 0$, and that $D(E) \le \delta$ for some conveniently small δ.



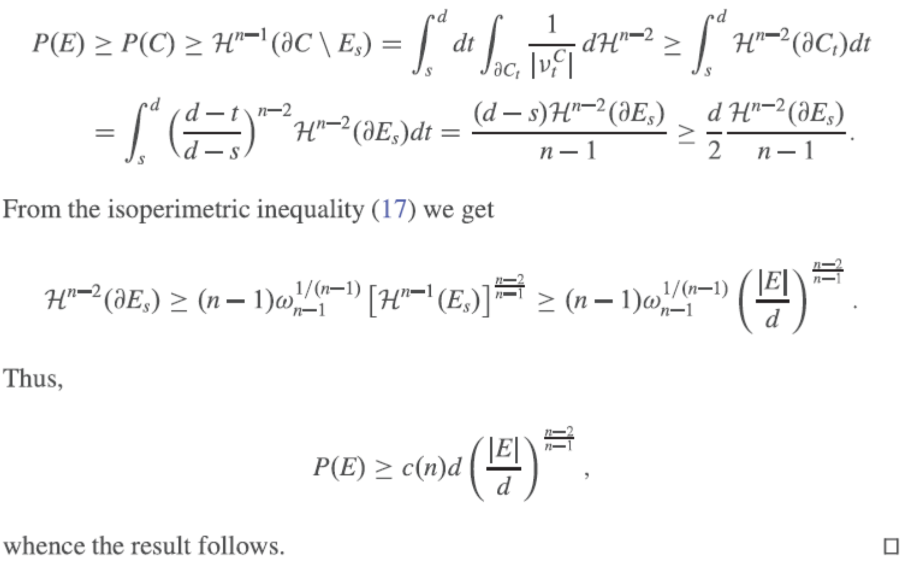
Lemma 31 *Let $E \subset \mathbb{R}^n$ be a bounded open convex set. Then*

$$\operatorname{diam}(E) \le c(n) \frac{[P(E)]^{n-1}}{|E|^{n-2}}.$$

Proof First observe that if $n = 2$ we trivially have $\operatorname{diam}(E) \le \frac{1}{2}P(E)$.

So let us assume $n \ge 3$. Let $x, y \in \partial E$ be such that $\operatorname{diam}(E) := d = |x-y|$. Then, rotate and translate E so to reduce to the situation shown in Fig. 12.

By Fubini's Theorem, $|E| = \int_0^d \mathcal{H}^{n-1}(E_t)dt$, where $E_t = E \cap \{x_n = t\}$. Observe that there exists $s \in (0, d)$ such that $\mathcal{H}^{n-1}(E_s) \ge |E|/d$. Note that we may always assume that $0 < s \le d/2$ (otherwise we just rotate E upside down). Let C be the



$$P(E) \ge P(C) \ge \mathcal{H}^{n-1}(\partial C \setminus E_s) = \int_s^d dt \int_{\partial C_t} \frac{1}{|\nu_t^C|} d\mathcal{H}^{n-2} \ge \int_s^d \mathcal{H}^{n-2}(\partial C_t)dt$$

$$= \int_s^d \left(\frac{d-t}{d-s}\right)^{n-2} \mathcal{H}^{n-2}(\partial E_s)dt = \frac{(d-s)\mathcal{H}^{n-2}(\partial E_s)}{n-1} \ge \frac{d}{2}\frac{\mathcal{H}^{n-2}(\partial E_s)}{n-1}.$$

From the isoperimetric inequality (17) we get

$$\mathcal{H}^{n-2}(\partial E_s) \ge (n-1)\omega_{n-1}^{1/(n-1)} \left[\mathcal{H}^{n-1}(E_s)\right]^{\frac{n-2}{n-1}} \ge (n-1)\omega_{n-1}^{1/(n-1)} \left(\frac{|E|}{d}\right)^{\frac{n-2}{n-1}}.$$

Thus,

$$P(E) \ge c(n) d \left(\frac{|E|}{d}\right)^{\frac{n-2}{n-1}},$$

whence the result follows. □

We obtain:

$$\frac{d}{2}\frac{\mathcal{H}^{n-2}(\partial E_s)}{n-1}.$$

$$\mathcal{H}^{n-2}(\partial E_s) \geq (n-1)\omega_{n-1}^{1/(n-1)}\left[\mathcal{H}^{n-1}(E_s)\right]^{\frac{n-2}{n-1}} \geq (n-1)\omega_{n-1}^{1/(n-1)}\left(\frac{|E|}{d}\right)^{\frac{n-2}{n-1}}.$$

Thence, consodering E = B :

d/2*1/(n-1) * (n-1)* ((2*Pi^(10/2))/(gamma(10/2)))^(1/(n-1))*(B/d)^((n-2)/(n-1))

Input

$$\frac{d}{2}\times\frac{1}{n-1}(n-1)\sqrt[n-1]{\frac{2\pi^{10/2}}{\Gamma\left(\frac{10}{2}\right)}}\left(\frac{B}{d}\right)^{(n-2)/(n-1)}$$

γ is the Euler-Mascheroni constant

Result

1729.00…

1729

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve $1728 = 8^2 \times 3^3$. The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways $10^3 + 9^3 = 12^3 + 1^3 = 1729$ and Ramanujan's recurring number). Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string. Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron. As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string. That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2.

Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after? That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

(1/27((sqrt((64^(9/10) (11) 2^(1/10) - (sqrt(π) 64^(9/10) 2^(1/10))/(2 2^(1/5) 3^(1/10)))/(240 π^4*6.6743*10^-11*125))+144+34+5-γ)-1))^2

Input interpretation

$$\left(\frac{1}{27}\left(\left(\sqrt{\frac{64^{9/10}\times 11\sqrt[10]{2}-\frac{\sqrt{\pi}\times 64^{9/10}\sqrt[10]{2}}{2\sqrt[5]{2}\sqrt[10]{3}}}{240\pi^4\times 6.6743\times 10^{-11}\times 125}}+144+34+5-\gamma\right)-1\right)\right)^2$$

γ is the Euler-Mascheroni constant

Result

4096.02…

4096.02…. ≈ 4096

The number 4096 = 64^2, is the Ramanujan Recurring Number, that when multiplied by 2 give 8192. The total amplitude vanishes for gauge group SO(8192) for bosonic string SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). This could be the implications for a pre-big bang scenario where only self-perturbative bosonic strings lived when the enthalpy was extremely low as discussed above. This regime contains all the intrinsic properties of superstrings inherent in the bosonic strings, would at the big bang give effect to the properties of matter (fermions) as Higgs Boson.

This number theoretic connection to the gauge group SO(8192), gives a much more compelling relevance of the bosonic string theory SO(8192), to quantum gravity and places this string theory where it should appropriately be in the evolution of the universe from a quantum gravity perspective rather than it be neglected because it doesn't include fermionic strings to confirm to post big-bang reality. The vanishing of the bosonic string's amplitude could be explained by the effect of extreme low entropy on the quantum vacuum geometry. Thus, as the entropy increases infinitesimally as a result of the vacuum self-perturbation then also is the amplitude of the vibrating bosonic strings from zero. Thus, was right to indicate that the "vanishing of the amplitude of the bosonic string could be the results of string theory itself", but here, we give a much more elaborate explanation of what could be happening.

From

https://ned.ipac.caltech.edu/level5/Watson/Watson5_3.html

We analyze the following equation concerning the **Inflation and Scalar Fields**:

$$-\frac{\dot{H}}{H^2}=\frac{M_p^2}{16\pi}\left(\frac{V'}{V}\right)^2<1.$$

this is just the slow-roll condition ε << 1. So the inflation will take place until ε ~ 1, which has been shown to be equivalent to $\ddot{a} > 0$.

We have:

$$\frac{M_P^2}{16\pi}\left(\frac{V'}{V}\right)^2 < 1$$

considering

$$\frac{M_P^2}{16\pi}\left(\frac{V'}{V}\right)^2 = \frac{2\sqrt{2}}{\pi}$$

we obtain:

$$\frac{M_P^2}{16\pi}\frac{2V}{V^2} = \frac{2\sqrt{2}}{\pi}$$

((M^2)/(16π)) (2V)/V^2 = (2√2)/π

Input

$$\frac{M^2}{16\,\pi}\times\frac{2\,V}{V^2} = \frac{2\,\sqrt{2}}{\pi}$$

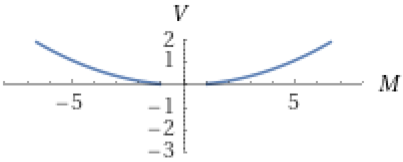
Exact result

$$\frac{M^2}{8\,\pi\,V} = \frac{2\,\sqrt{2}}{\pi}$$

Geometric figure

parabola

Implicit plot **(figure that can be related to an open string)**



Alternate form assuming M and V are real

$$\frac{M^2}{V} = 16\sqrt{2}$$

Alternate form

$$V = \frac{M^2}{16\sqrt{2}}$$

Alternate form assuming M and V are positive

$$M^2 = 16\sqrt{2}\ V$$

Solution

$$V = \frac{M^2}{16\sqrt{2}}\ , \quad M \neq 0$$

Implicit derivatives

$$\frac{\partial M(V)}{\partial V} = \frac{8\sqrt{2}}{M}$$

$$\frac{\partial V(M)}{\partial M} = \frac{M}{8\sqrt{2}}$$

From

$$V = \frac{M^2}{16\sqrt{2}}$$

for M = 1.2209×10^{19} GeV/c^2 , we obtain:

(1.2209*10^19)^2/(16sqrt2)

Input interpretation

$$\frac{(1.2209\times 10^{19})^2}{16\sqrt{2}}$$

Result

$6.58757\ldots\times 10^{36}$

Conclusions

These calculations suggest a deep connection between the DN Constant, the Hubble parameter, and fundamental mathematical properties such as the value of $\zeta(2)$. These connections could offer new insights into the structure of the universe and the physical laws that govern it. The connection between the DN Constant and the Hubble parameter could lead to new models of cosmic inflation. For example, if the DN Constant represents a fundamental symmetry, it could help develop more accurate potentials for the scalar field, improving our understanding of the initial conditions of the universe and the quantum fluctuations that led to the formation of cosmic structures. The DN Constant could influence the estimate of the vacuum energy, which is crucial for inflation and the accelerated expansion of the universe. A better understanding of this energy could help solve open problems such as the cosmological constant and dark energy. The mathematical connections between the DN Constant and the fundamental constants could have implications for string theory and the concept of the multiverse. For example, if the DN Constant is tied to the geometry of spacetime, it could provide clues to how the extra dimensions of string theory influence the expansion of the universe and the formation of inflationary bubbles. If the DN Constant represents a symmetry or invariant in the inflation equations, it could lead to the discovery of new conservation laws. These laws could be used to develop more unified theories of physics, linking quantum gravity with other fundamental forces. Connections between the DN Constant and mathematical constants such as π and $\zeta(2)$ could reveal new properties of physical constants. For example, new relationships between Planck's constants, the speed of light, and the gravitational constant could emerge, improving our understanding of fundamental interactions. Connections between the DN Constant and the Hubble parameter could provide new insights into the structure of the early universe. For example, they could help explain the distribution of density fluctuations that led to the formation of galaxies and other cosmic structures.

These examples show how connections between the DN Constant and other fundamental constants could open up new avenues of research and improve our understanding of the universe.

On the application of the formulas of the volumes of an octahedron and a sphere

With regard to a sphere inscribed in an octahedron, we have the following formulas.

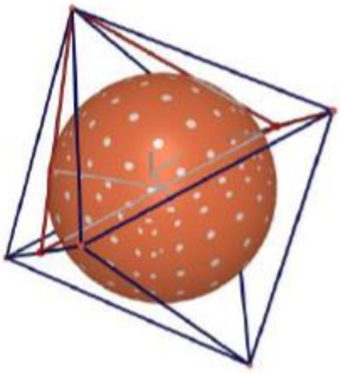

Fig: sphere inscribed in an octahedron

$V_0 = \frac{1}{3}\sqrt{2}\,l^3$

$V_s = \frac{4}{3}\pi r^3$; where $r_s = (l/2)$

With regard the ratio between the two above formulas (octahedron and sphere)

(1/3*√2*l^3)/(4/3*π*(l/2)^3)

we obtain:

Input

$$\frac{\frac{1}{3}\sqrt{2}\,l^3}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^3}$$

Result

$$\frac{\sqrt{2}\ 2}{\pi} \quad (\text{for } l \neq 0)$$

$$4\left(\frac{1}{z_0}\right)^{\lfloor\arg(2-z_0)/(2\pi)\rfloor} z_0^{1+\lfloor\arg(2-z_0)/(2\pi)\rfloor}\left(\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(2-z_0)^k z_0^{-k}}{k!}\right)^2$$

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x\rfloor$ is the floor function

i is the imaginary unit

6π*√2((1/3*√2*l^3)/(4/3*π*(l/2)^3))

Input

$$6\pi\sqrt{2}\times\frac{\frac{1}{3}\sqrt{2}\,l^3}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^3}$$

Exact result

24

24

The value 24 is linked to the "Ramanujan function" (an elliptic modular function that satisfies the need for "conformal symmetry") that has 24 "modes" corresponding to the physical vibrations of a bosonic string representing a bosons. From the analysis, we observe that the is no number theoretic connection with physical vibrations of fermionic strings at extremally low entropy. This fact is confirmed by the fact that the Higgs bosons at the moment of the big bang and infinitesimally shortly thereafter, facilitated the creation of fermions (matter and antimatter particles) [8]. Thus we note that the ingredients for the formation of electromagnetic radiation from photons (a Boson), and the formation of matter from the Higgs boson after the big bang, are intrinsic properties of the vacuum energy in pre-big bang.

Series representations

$$\frac{\left(6\pi\sqrt{2}\right)\left(\sqrt{2}\,l^3\right)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3}=12\sqrt{z_0}^{\,2}\left(\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(2-z_0)^k\,z_0^{-k}}{k!}\right)^2$$

for (not ($z_0\in\mathbb{R}$ and $-\infty < z_0 \le 0$))

$$\frac{\left(6\pi\sqrt{2}\right)\left(\sqrt{2}\,l^3\right)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3} = 12\exp^2\left(i\pi\left\lfloor\frac{\arg(2-x)}{2\pi}\right\rfloor\right)\sqrt{x}^{\,2}\left(\sum_{k=0}^{\infty}\frac{(-1)^k\,(2-x)^k\,x^{-k}\left(-\frac{1}{2}\right)_k}{k!}\right)^2$$

for $(x \in \mathbb{R}$ and $x < 0)$

$$\frac{\left(6\pi\sqrt{2}\right)\left(\sqrt{2}\,l^3\right)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3} =$$

$$12\left(\frac{1}{z_0}\right)^{\lfloor\arg(2-z_0)/(2\pi)\rfloor} z_0^{1+\lfloor\arg(2-z_0)/(2\pi)\rfloor}\left(\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(2-z_0)^k\,z_0^{-k}}{k!}\right)^2$$

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x\rfloor$ is the floor function

i is the imaginary unit

This could imply that all matter (fermions) was preceded by bosons. That is, before the Big Bang, from perturbations of the vacuum energy itself, bosons were created, and successively at the Big Bang, and infinitesimally shortly after the Big Bang, fermions, were created from the vacuum energy that underwent a violent “breaking” that formed a hot plasma. of particle-antiparticle pairs. This therefore implies that quantum gravity was not necessarily “dark” to some extent, because a photon (light particle) is itself a boson. Therefore, a big bang was not necessarily the moment of the creation of light, but of the creation of matter (fermions) from vacuum energy, as this undergoes further "breaking" in the cosmological constant, in the hot plasma of matter and in the energy dark.

(2π*√2((1/3*√2*l^3)/(4/3*π*(l/2)^3)))^4

Input

$$\left(2\pi\sqrt{2}\times\frac{\frac{1}{3}\sqrt{2}\,l^3}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^3}\right)^4$$

Exact result

4096

4096 = 64^2 , (Ramanujan Recurring Number) that multiplied by 2 give 8192, indeed:

The total amplitude vanishes for gauge group SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). (From: "Dilaton Tadpole for the Open Bosonic String " Michael R. Douglas and Benjamin Grinstein - September 2,1986)

27*sqrt((2π*√2((1/3*√2*l^3)/(4/3*π*(l/2)^3)))^4)+1

Input

$$27\sqrt{\left(2\pi\sqrt{2}\times\frac{\frac{1}{3}\sqrt{2}\,l^3}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^3}\right)^4}+1$$

Exact result

1729

1729

This result is very near to the mass of candidate glueball f_0(1710) scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve (1728 = $8^2 * 3^3$).

The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways ($10^3 + 9^3 = 12^3 + 1^3 = 1729$) and Ramanujan's recurring number)

Series representations

$$27\sqrt{\left(\frac{\left(2\pi\sqrt{2}\right)\left(\sqrt{2}\,l^3\right)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3}\right)^4}+1=$$
$$1+27\sqrt{-1+256\sqrt{2}^8}\sum_{k=0}^{\infty}\binom{\frac{1}{2}}{k}\left(-1+256\sqrt{2}^8\right)^{-k}$$

i is the imaginary unit

Integral representation

$$(1+z)^a = \frac{\int_{-i\infty+\gamma}^{i\infty+\gamma}\frac{\Gamma(s)\Gamma(-a-s)}{z^s}\,ds}{(2\pi i)\Gamma(-a)} \quad \text{for } (0<\gamma<-\mathrm{Re}(a) \text{ and } |\arg(z)|<\pi)$$

$\Gamma(x)$ is the gamma function

$\mathrm{Re}(z)$ is the real part of z

$|z|$ is the absolute value of z

Furthermore, from the formula

$$2^{-1/\pi}\sqrt[2\pi]{5\left(3+\sqrt{5}\right)\pi}$$

we obtain also:

(4 (1.6180085459)^(2 π))/(5 (3 + sqrt(5))) = 3.1415926535

Indeed:

$$\frac{4\times 1.6180085459^{2\pi}}{5\left(3+\sqrt{5}\right)}$$

3.1415926535884871624221932509858715278931025189245576170078100613

...

3.1415926535…. = π (Ramanujan Recurring Number)

From the following extended DN Constant (“Unitary Formula”)

$$\sqrt[2\pi]{\frac{\frac{5}{12}(3+\sqrt{5})d^3}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3} \times \frac{1}{\frac{\frac{1}{3}\sqrt{2}a^3}{\frac{4}{3}\pi\left(\frac{a}{2}\right)^3}} \times \frac{1}{\frac{\sqrt{2}}{12}d^3 \cdot \frac{1}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}}} \times \sqrt[3]{-\frac{q}{2}+\sqrt{\frac{q^2}{4}+\frac{p^3}{27}}} + \sqrt[3]{-\frac{q}{2}-\sqrt{\frac{q^2}{4}+\frac{p^3}{27}}}$$

with regard

$$\sqrt[3]{-\frac{q}{2}+\sqrt{\frac{q^2}{4}+\frac{p^3}{27}}} + \sqrt[3]{-\frac{q}{2}-\sqrt{\frac{q^2}{4}+\frac{p^3}{27}}}$$

for q = 1729 and p = 4096, we obtain by changing the sign in the algebraic sum of the aforementioned Cardano’s Formula and after some calculations:

$$2^{-1/\pi}\sqrt[2\pi]{5\left(3+\sqrt{5}\right)\pi}$$

multiplied by

$$\sqrt[9]{\sqrt[3]{-\frac{1729}{2}+\sqrt{\frac{1729^2}{4}+\frac{4096^3}{27}}} - \sqrt[3]{-\frac{1729}{2}-\sqrt{\frac{1729^2}{4}+\frac{4096^3}{27}}}}$$

and performing the ninth root of the entire expression:

√((2^(-1/π)(5(3+√(5))π)^(1/(2π)))((∛(-1729/2+√(1729^2/4+4096^3/27)) -∛(-1729/2-√(1729^2/4+4096^3/27)))^1/9))

we obtain:

$$\sqrt{\left(\left(2^{-1/\pi}\sqrt[2\pi]{5\left(3+\sqrt{5}\right)\pi}\right)\sqrt[9]{\sqrt[3]{-\frac{1729}{2}+\sqrt{\frac{1729^2}{4}+\frac{4096^3}{27}}}-\sqrt[3]{-\frac{1729}{2}-\sqrt{\frac{1729^2}{4}+\frac{4096^3}{27}}}}\right)}$$

$$2^{-1/(2\pi)}\sqrt[18]{\sqrt[3]{\frac{\sqrt{\frac{274958621851}{3}}}{6}-\frac{1729}{2}}+\sqrt[3]{\frac{1729}{2}+\frac{\sqrt{\frac{274958621851}{3}}}{6}}}\ \sqrt[4\pi]{5\left(3+\sqrt{5}\right)\pi}$$

i.e.

2^(-1/(2π)) ((-1729/2+√(274958621851/3)/6)^(1/3)+(1729/2 + √(274958621851/3)/6)^(1/3))^(1/18) (5(3+√(5)) π)^(1/(4π))

= 1.61549140391….

The general "unitary" formula, which derives from DN Constant, is the following:

$$\sqrt{2\times\frac{2\cdot\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{1}{\pi\cdot 0.9991104684}\left(C\times \mathrm{R}\times 2.33\cdot 10^{-13}\right)}}\cong 1.61803398\ldots=\frac{\sqrt{5}+1}{2}$$

Where $\frac{2\sqrt{2}}{\pi}$ is the Del Gaudio-Nardelli Constant, 0.9991104684 is the value of the following Rogers-Ramanujan continued fraction:

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\cfrac{e^{-\pi\sqrt{5}}}{1+\cfrac{e^{-2\pi\sqrt{5}}}{1+\cfrac{e^{-3\pi\sqrt{5}}}{1+\cfrac{e^{-4\pi\sqrt{5}}}{1+\ldots}}}}\approx 0.9991104684$$

C is any constant or solution to an equation, R is the radius of the Universe and $2.33*10^{-13}$ is the temperature of the universe expressed in GeV.

For example, $C = 9.9128$, inserting a radius of the Universe, which we have calculated, equal to $R = 2.06274*10^{12}$ years, from DN Constant "unitary" formula, we obtain:

√(2×(2·(((2√2)/π))^(1/16))/(1/(π·0.9991104684) (9.9128×(2.06274 × 10^12)×2.33·10^(-13))))

$$\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{1}{\pi\times 0.9991104684}\times\frac{9.9128\times 2.06274\times 10^{12}\times 2.33}{10^{13}}}}$$

1.6180359123482642354401744088347098542545273508401733563064818107…

1.618035912348…. result that is a very good approximation to the value of the golden ratio 1.618033988749… (Ramanujan Recurring Number)

We obtain also:

(√(2×(2·(((2√2)/π))^(1/16))/(1/(π·0.9991104684) (9.9128×(2.06274 × 10^12)×2.33·10^(-13)))))dxdydz

Indefinite integral assuming all variables are real

$0.809018\,x^2\,y\,z + \text{constant}$

Definite integral over a cube of edge length 2 L

$$\int_{-L}^{L}\int_{-L}^{L}\int_{-L}^{L} 1.61804\, dx\, dy\, dz = 12.9443\, L^3$$

Definite integral over a sphere of radius R

$$\iiint\limits_{x^2+y^2+z^2<R^2} 1.61804\, dz\, dy\, dx = 6.77761\, R^3$$

From which, for L = R = 1 , dividing the two definite integral results by the original expression, we obtain:

12.9443/(√(2×(2·(((2√2)/π))^(1/16))/(1/(π·0.9991104684) (9.9128×(2.06274 × 10^12)×2.33·10^(-13)))))

Input interpretation

$$\frac{12.9443}{\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{1}{\pi\times 0.9991104684}\times\frac{9.9128\times 2.06274\times 10^{12}\times 2.33}{10^{13}}}}}$$

Result

New fundamental formula deriving from DN Constant

The DN Constant (Del Gaudio-Nardelli Constant) equals (2√2)/π) is defined as the ratio of the volume of an octahedron to the volume of a sphere and is an intriguing mathematical concept. Michele Nardelli hypothesized that the regular octahedron represents a phase in which the universe is highly symmetrical and with very low entropy. On the other hand, the sphere (which is inscribed in the octahedron, i.e. is "inside" it) represents the universe emerging from the quantum vacuum, which over time increases entropy and undergoes various symmetry breakings. This occurs in a regime of eternal inflation.

From the following expression

√(2×(2·(((2√2)/π)^(1/16)))/(4096/(π·0.9991104684) (((1.616255*10^-35)/(1.1056*10^-52))×C×R)))

$$\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{4096}{\pi\times 0.9991104684}\left(\frac{1.616255\times 10^{-35}}{1.1056\times 10^{-52}}\,C\,R\right)}}$$

which comes from the DN Constant, with $1.616255*10^{-35}$ which is equal to the Planck length, $1.1056*10^{-52}$ which is equal to the Cosmological Constant, C = 1729 which corresponds to the Hardy-Ramanujan number and R = $4.6018401361 \times 10^{-24}$, which represents the radius of the Universe, we obtain:

√(2×(2·(((2√2)/π)^(1/16)))/(4096/(π·0.9991104684) (((1.616255*10^-35)/(1.1056*10^-52))×1729×4.6018401361 × 10^-24))) = 1.6180329973...

$$\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{4096}{\pi\times 0.9991104684}\left(\frac{1.616255\times 10^{-35}}{1.1056\times 10^{-52}}\times 1729\times 4.6018401361\times 10^{-24}\right)}}$$

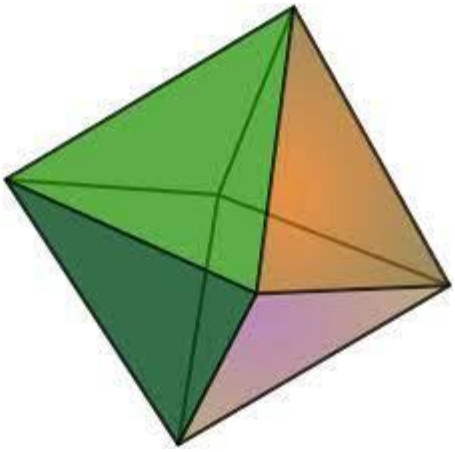
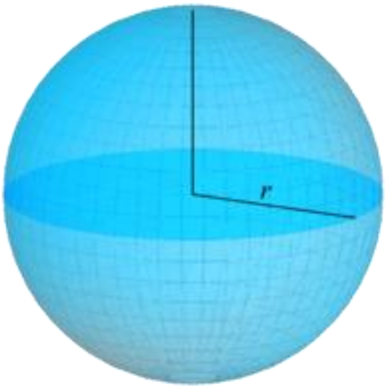
3.14159225731469…≈ π (Ramanujan Recurring Number)

Now, we have that:



Octahedron



Sphere

Given the value of a volume, independently of the solid, following the Poincaré Conjecture, we compare any solid "without holes" and a sphere. If we compare an octahedron with a sphere, we have:

$$\frac{4}{3}\pi r^3 = \frac{1}{3}\sqrt{2}a^3$$

If we consider the radius of the sphere as an unknown, we must find the value of the side of the octahedron which allows us to equalize the two volumes and which will give us the DN Constant as a result (which will therefore be equal to the radius of the sphere).

From

$$\frac{4}{3}\pi r^3 = \frac{1}{3}\sqrt{2}a^3$$

To find r we perform the following calculation:

$$r^3 = \frac{\frac{1}{3}\sqrt{2}a^3}{\frac{4}{3}\pi} = \frac{1}{3}\sqrt{2}a^3 \cdot \frac{3}{4\pi} = \frac{\sqrt{2}a^3}{4\pi} = \frac{\sqrt{2}\cdot\sqrt{2}a^3}{\sqrt{2}\cdot 4\pi} = \frac{2a^3}{\sqrt{2}\cdot 4\pi} = \frac{a^3}{2\sqrt{2}\pi}$$

$$r^3 = \frac{a^3}{2\sqrt{2}\pi}; \qquad r = \sqrt[3]{\frac{a^3}{2\sqrt{2}\pi}} = \frac{a}{\sqrt[3]{2\sqrt{2}\pi}}$$

To find a, we have, for

$$r = \frac{2\sqrt{2}}{\pi}; \qquad \frac{a}{\sqrt[3]{2\sqrt{2}\pi}} = \frac{2\sqrt{2}}{\pi};$$

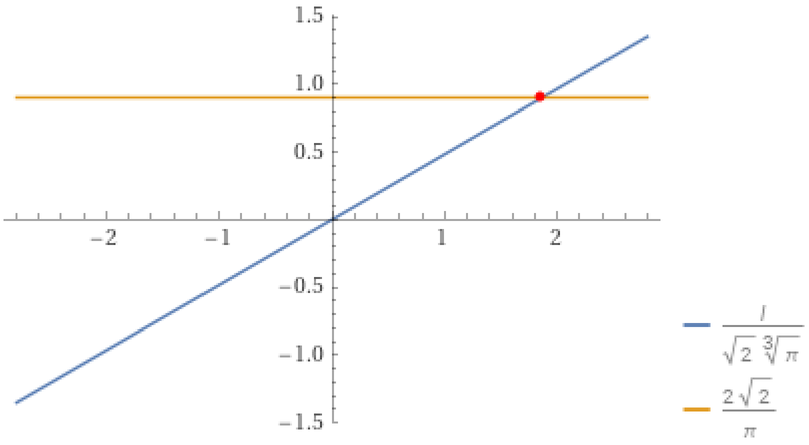
Thus, multiplying both the sides by $\sqrt[3]{2\sqrt{2}\pi}$, we obtain:

$$a = \frac{2\sqrt{2}}{\pi} \cdot \sqrt[3]{2\sqrt{2}\pi} = \sqrt[3]{\frac{\left(2\sqrt{2}\right)^3 2\sqrt{2}\pi}{\pi^3}} =$$

$$= \sqrt[3]{\frac{8\cdot\sqrt{2^3}\cdot 2\sqrt{2}}{\pi^2}} = \sqrt[3]{\frac{8\cdot\sqrt{2\cdot 2^2}\cdot 2\sqrt{2}}{\pi^2}} = \sqrt[3]{\frac{16\cdot\sqrt{2}\cdot 2\sqrt{2}}{\pi^2}}$$

$$= \sqrt[3]{\frac{32\sqrt{2}\sqrt{2}}{\pi^2}} = \sqrt[3]{\frac{32\cdot 2}{\pi^2}} = \frac{\sqrt[3]{64}}{\sqrt[3]{\pi^2}} = \frac{4}{\sqrt[3]{\pi^2}}; \; a = \frac{4}{\sqrt[3]{\pi^2}}$$

Plot



Solution

$a = \frac{4}{\sqrt[3]{\pi^2}}$

for V = 1/3*√2*a^3 (octahedron volume) and V = (4/3*π*r^3) (sphere volume), we obtain:

from the octahedron volume, we have: V = 1/3*√2*a^3 = (1/3*√2*($\frac{4}{\sqrt[3]{\pi^2}}$)^3)

(1/3*√2*(4/∛(π^2))^3)

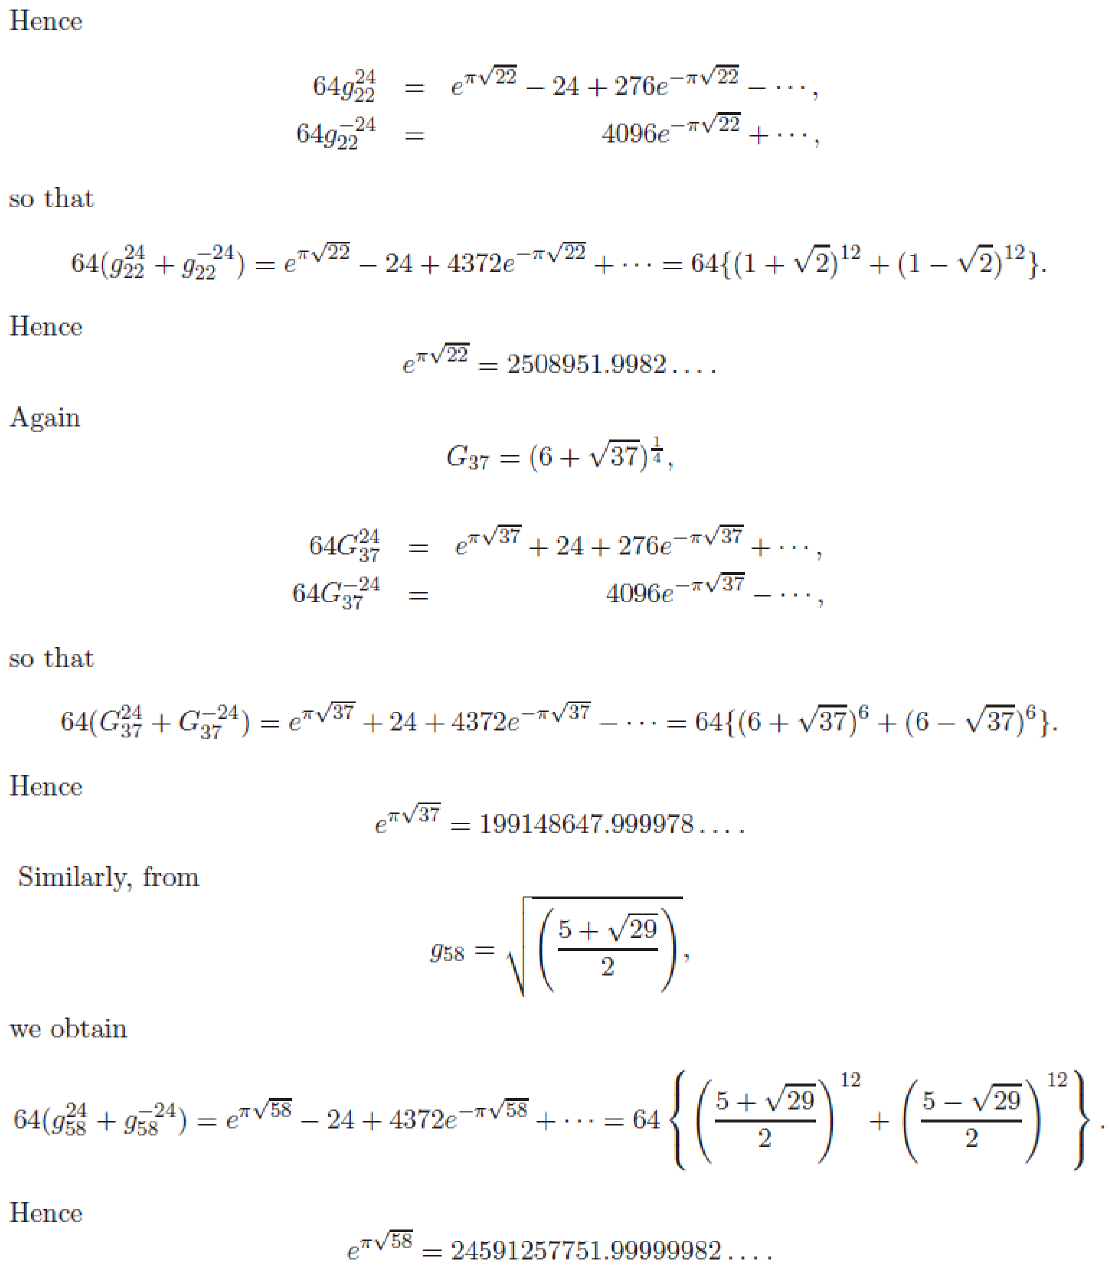
From:

Modular equations and approximations to π - *Srinivasa Ramanujan* - Quarterly Journal of Mathematics, XLV, 1914, 350 – 372

We have that:



Hence

$$\begin{aligned} 64g_{22}^{24} &= e^{\pi\sqrt{22}} - 24 + 276e^{-\pi\sqrt{22}} - \cdots, \\ 64g_{22}^{-24} &= 4096e^{-\pi\sqrt{22}} + \cdots, \end{aligned}$$

so that

$$64(g_{22}^{24} + g_{22}^{-24}) = e^{\pi\sqrt{22}} - 24 + 4372e^{-\pi\sqrt{22}} + \cdots = 64\{(1+\sqrt{2})^{12} + (1-\sqrt{2})^{12}\}.$$

Hence

$$e^{\pi\sqrt{22}} = 2508951.9982\ldots.$$

Again

$$G_{37} = (6+\sqrt{37})^{\frac{1}{4}},$$

$$\begin{aligned} 64G_{37}^{24} &= e^{\pi\sqrt{37}} + 24 + 276e^{-\pi\sqrt{37}} + \cdots, \\ 64G_{37}^{-24} &= 4096e^{-\pi\sqrt{37}} - \cdots, \end{aligned}$$

so that

$$64(G_{37}^{24} + G_{37}^{-24}) = e^{\pi\sqrt{37}} + 24 + 4372e^{-\pi\sqrt{37}} - \cdots = 64\{(6+\sqrt{37})^{6} + (6-\sqrt{37})^{6}\}.$$

Hence

$$e^{\pi\sqrt{37}} = 199148647.999978\ldots.$$

Similarly, from

$$g_{58} = \sqrt{\left(\frac{5+\sqrt{29}}{2}\right)},$$

we obtain

$$64(g_{58}^{24} + g_{58}^{-24}) = e^{\pi\sqrt{58}} - 24 + 4372e^{-\pi\sqrt{58}} + \cdots = 64\left\{\left(\frac{5+\sqrt{29}}{2}\right)^{12} + \left(\frac{5-\sqrt{29}}{2}\right)^{12}\right\}.$$

Hence

$$e^{\pi\sqrt{58}} = 24591257751.99999982\ldots.$$

We note that, with regard 4372, we can to obtain the following results:

27((4372)^1/2-2-1/2(((√(10-2√5) -2))/((√5-1))))+φ

Input

$$27\left(\sqrt{4372}-2-\frac{1}{2}\times\frac{\sqrt{10-2\sqrt{5}}-2}{\sqrt{5}-1}\right)+\phi$$

ϕ is the golden ratio

From:

An Update on Brane Supersymmetry Breaking - *J. Mourad and A. Sagnotti* - arXiv:1711.11494v1 [hep-th] 30 Nov 2017

From the following vacuum equations:

$$T\, e^{\gamma_E\, \phi} \;=\; -\, \frac{\beta_E^{(p)}\, h^2}{\gamma_E}\, e^{-2\,(8-p)\,C + 2\,\beta_E^{(p)}\,\phi}$$

$$16\, k'\, e^{-2C} \;=\; \frac{h^2\left(p\,+\,1\,-\,\frac{2\,\beta_E^{(p)}}{\gamma_E}\right) e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}}{(7\,-\,p)}$$

$$(A')^2 \;=\; k\, e^{-2A} \,+\, \frac{h^2}{16(p\,+\,1)}\left(7\,-\,p\,+\,\frac{2\,\beta_E^{(p)}}{\gamma_E}\right) e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}$$

we have obtained, from the results almost equals of the equations, putting

$4096\, e^{-\pi\sqrt{18}}$ instead of

$$e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}$$

a new possible mathematical connection between the two exponentials. Thence, also the values concerning p, C, β_E and ϕ correspond to the exponents of e (i.e. of exp). Thence we obtain for p = 5 and $\beta_E = 1/2$:

$$e^{-6C+\phi} = 4096e^{-\pi\sqrt{18}}$$

Therefore, with respect to the exponentials of the vacuum equations, the Ramanujan's exponential has a coefficient of 4096 which is equal to 64^2, while $-6C+\phi$ is equal to $-\pi\sqrt{18}$. From this it follows that it is possible to establish mathematically, the dilaton value.

For

exp((-Pi*sqrt(18)) we obtain:

Input:

$$\exp\left(-\pi\sqrt{18}\right)$$

Exact result:

$$e^{-3\sqrt{2}\,\pi}$$

Decimal approximation:

$$1.6272016226072509292942156739117979541838581136954016\ldots\times10^{-6}$$

$1.6272016\ldots * 10^{-6}$

Property:

$e^{-3\sqrt{2}\,\pi}$ is a transcendental number

Series representations:

$$e^{-\pi\sqrt{18}}=e^{-\pi\sqrt{17}\sum_{k=0}^{\infty}17^{-k}\binom{1/2}{k}}$$

$$e^{-\pi\sqrt{18}}=\exp\left(-\pi\sqrt{17}\sum_{k=0}^{\infty}\frac{\left(-\frac{1}{17}\right)^k\left(-\frac{1}{2}\right)_k}{k!}\right)$$

$$e^{-\pi\sqrt{18}}=\exp\left(-\frac{\pi\sum_{j=0}^{\infty}\operatorname{Res}_{s=-\frac{1}{2}+j}17^{-s}\,\Gamma\left(-\frac{1}{2}-s\right)\Gamma(s)}{2\sqrt{\pi}}\right)$$

Now, we have the following calculations:

$$e^{-6C+\phi} = 4096e^{-\pi\sqrt{18}}$$

$$e^{-\pi\sqrt{18}} = 1.6272016\ldots * 10^{-6}$$

from which:

$$\frac{1}{4096}e^{-6C+\phi} = 1.6272016\ldots * 10^{-6}$$

$$0.000244140625\ e^{-6C+\phi} = e^{-\pi\sqrt{18}} = 1.6272016\ldots * 10^{-6}$$

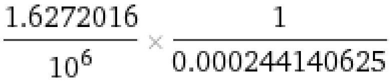
Now:

$$\ln\left(e^{-\pi\sqrt{18}}\right) = -13.328648814475 = -\pi\sqrt{18}$$

And:

(1.6272016* 10^-6) *1/ (0.000244140625)

Input interpretation:



$$\frac{1.6272016}{10^6} \times \frac{1}{0.000244140625}$$

Result:

0.0066650177536

0.006665017...

Thence:

$$0.000244140625\ e^{-6C+\phi} = e^{-\pi\sqrt{18}}$$

Dividing both sides by 0.000244140625, we obtain:

$$\frac{0.000244140625}{0.000244140625}\,e^{-6C+\phi} = \frac{1}{0.000244140625}\,e^{-\pi\sqrt{18}}$$

$$e^{-6C+\phi} = 0.0066650177536$$

((((exp((-Pi*sqrt(18)))))))*1/0.000244140625

Input interpretation:

$$\exp\left(-\pi\sqrt{18}\right)\times\frac{1}{0.000244140625}$$

Result:

0.00666501785...

0.00666501785…

Series representations:

$$\frac{\exp(-\pi\sqrt{18})}{0.000244141} = 4096\exp\left(-\pi\sqrt{17}\sum_{k=0}^{\infty}17^{-k}\binom{\frac{1}{2}}{k}\right)$$

$$\frac{\exp(-\pi\sqrt{18})}{0.000244141} = 4096\exp\left(-\pi\sqrt{17}\sum_{k=0}^{\infty}\frac{\left(-\frac{1}{17}\right)^{k}\left(-\frac{1}{2}\right)_{k}}{k!}\right)$$

$$\frac{\exp(-\pi\sqrt{18})}{0.000244141} = 4096\exp\left(-\frac{\pi\sum_{j=0}^{\infty}\operatorname{Res}_{s=-\frac{1}{2}+j}17^{-s}\,\Gamma\left(-\frac{1}{2}-s\right)\Gamma(s)}{2\sqrt{\pi}}\right)$$

Now:

$$e^{-6C+\phi} = 0.0066650177536$$

$$\exp\left(-\pi\sqrt{18}\right)\times\frac{1}{0.000244140625} =$$

$$e^{-\pi\sqrt{18}}\times\frac{1}{0.000244140625}$$

$$= 0.00666501785\ldots$$

From:

ln(0.00666501784619)

Input interpretation:

log(0.00666501784619)

Result:

$$\log(0.006665017846190000) = -\text{Li}_1(0.993334982153810000)$$

Series representations:

$$\log(0.006665017846190000) = -\sum_{k=1}^{\infty} \frac{(-1)^k\,(-0.993334982153810000)^k}{k}$$

$$\log(0.006665017846190000) = 2\,i\,\pi \left\lfloor \frac{\arg(0.006665017846190000 - x)}{2\,\pi} \right\rfloor + \log(x) - \sum_{k=1}^{\infty} \frac{(-1)^k\,(0.006665017846190000 - x)^k\,x^{-k}}{k} \quad \text{for } x < 0$$

$$\log(0.006665017846190000) = \left\lfloor \frac{\arg(0.006665017846190000 - z_0)}{2\,\pi} \right\rfloor \log\left(\frac{1}{z_0}\right) + \log(z_0) + \left\lfloor \frac{\arg(0.006665017846190000 - z_0)}{2\,\pi} \right\rfloor \log(z_0) - \sum_{k=1}^{\infty} \frac{(-1)^k\,(0.006665017846190000 - z_0)^k\,z_0^{-k}}{k}$$

Integral representation:

$$\log(0.006665017846190000) = \int_1^{0.006665017846190000} \frac{1}{t}\,dt$$

In conclusion:

$$-6C + \phi = -5.010882647757 \ldots$$

and for C = 1, we obtain:

$$\phi = -5.010882647757 + 6 = 0.989117352243 = \boldsymbol{\phi}$$

Note that the values of n_s (spectral index) 0.965, of the average of the Omega mesons Regge slope 0.987428571 and of the dilaton 0.989117352243, are also connected to the following two Rogers-Ramanujan continued fractions:

$$\frac{e^{-\frac{\pi}{5}}}{\sqrt{(\varphi-1)\sqrt{5}} - \varphi + 1} = 1 - \cfrac{e^{-\pi}}{1 + \cfrac{e^{-2\pi}}{1 + \cfrac{e^{-3\pi}}{1 + \cfrac{e^{-4\pi}}{1 + \ldots}}}} \approx 0.9568666373$$

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1 + \sqrt[5]{\sqrt{\varphi^5 \sqrt[4]{5^3}} - 1}} - \varphi + 1} = 1 - \cfrac{e^{-\pi\sqrt{5}}}{1 + \cfrac{e^{-2\pi\sqrt{5}}}{1 + \cfrac{e^{-3\pi\sqrt{5}}}{1 + \cfrac{e^{-4\pi\sqrt{5}}}{1 + \ldots}}}} \approx 0.9991104684$$

(http://www.bitman.name/math/article/102/109/)

Also performing the 512th root of the inverse value of the Pion meson rest mass 139.57, we obtain:

((1/(139.57)))^1/512

Input interpretation:

$$\sqrt[512]{\frac{1}{139.57}}$$

Result:

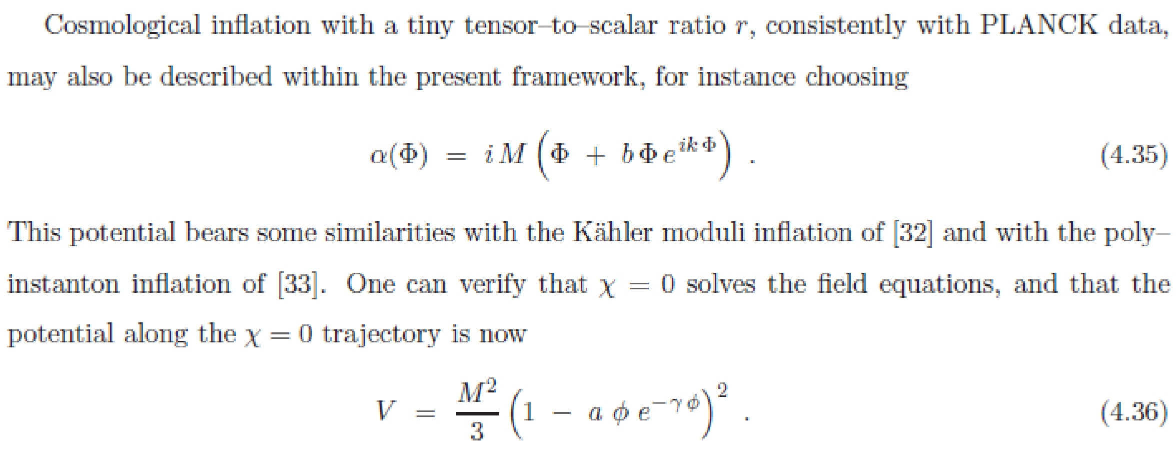
0.99040073.... result very near to the dilaton value 0.989117352243 = ***ϕ*** and to the value of the following Rogers-Ramanujan continued fraction:

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\frac{e^{-\pi\sqrt{5}}}{1+\frac{e^{-2\pi\sqrt{5}}}{1+\frac{e^{-3\pi\sqrt{5}}}{1+\frac{e^{-4\pi\sqrt{5}}}{1+\dots}}}}\approx 0.9991104684$$

From

Properties of Nilpotent Supergravity - *E. Dudas, S. Ferrara, A. Kehagias and A. Sagnotti* - arXiv:1507.07842v2 [hep-th] 14 Sep 2015

We have that:



Cosmological inflation with a tiny tensor–to–scalar ratio r, consistently with PLANCK data, may also be described within the present framework, for instance choosing

$$\alpha(\Phi) \;=\; i\,M\left(\Phi \;+\; b\,\Phi\,e^{ik\,\Phi}\right) \;. \tag{4.35}$$

This potential bears some similarities with the Kähler moduli inflation of [32] and with the poly–instanton inflation of [33]. One can verify that $\chi = 0$ solves the field equations, and that the potential along the $\chi = 0$ trajectory is now

$$V \;=\; \frac{M^2}{3}\left(1 \;-\; a\,\phi\,e^{-\gamma\,\phi}\right)^2 \;. \tag{4.36}$$

We analyzing the following equation:

$$V = \frac{M^2}{3}\left(1 - a\,\phi\,e^{-\gamma\phi}\right)^2 .$$

$$\phi = \varphi - \frac{\sqrt{6}}{k} ,$$

$$a = \frac{b\gamma}{e} < 0 , \qquad \gamma = \frac{k}{\sqrt{6}} < 0 .$$

We have:

(M^2)/3*[1-(b/euler number * k/sqrt6) * (φ- sqrt6/k) * exp(-(k/sqrt6)(φ-sqrt6/k))]^2

i.e.

V = (M^2)/3*[1-(b/euler number * k/sqrt6) * (φ- sqrt6/k) * exp(-(k/sqrt6)(φ-sqrt6/k))]^2

For k = 2 and φ = 0.9991104684, that is the value of the scalar field that is equal to the value of the following Rogers-Ramanujan continued fraction:

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1} = 1 - \frac{e^{-\pi\sqrt{5}}}{1+\frac{e^{-2\pi\sqrt{5}}}{1+\frac{e^{-3\pi\sqrt{5}}}{1+\frac{e^{-4\pi\sqrt{5}}}{1+\ldots}}}} \approx 0.9991104684$$

we obtain:

V = (M^2)/3*[1-(b/euler number * 2/sqrt6) * (0.9991104684- sqrt6/2) * exp(-(2/sqrt6)(0.9991104684- sqrt6/2))]^2

Input interpretation:

$$V = \frac{M^2}{3}\left(1-\left(\frac{b}{e}\times\frac{2}{\sqrt{6}}\right)\left(0.9991104684-\frac{\sqrt{6}}{2}\right)\exp\left(-\frac{2}{\sqrt{6}}\left(0.9991104684-\frac{\sqrt{6}}{2}\right)\right)\right)^2$$

Result:

$$V = \frac{1}{3}\,(0.0814845\,b+1)^2\,M^2$$

Solutions:

$$b = \frac{225.913\left(-0.054323\,M^2 \pm 6.58545\times10^{-10}\sqrt{M^4}\right)}{M^2}\quad (M \neq 0)$$

Alternate forms:

$$V = 0.00221324\,(b+12.2723)^2\,M^2$$

$$V = 0.00221324\left(b^2\,M^2 + 24.5445\,b\,M^2 + 150.609\,M^2\right)$$

$$-0.00221324\,b^2\,M^2 - 0.054323\,b\,M^2 - \frac{M^2}{3} + V = 0$$

Expanded form:

$$V = 0.00221324\,b^2\,M^2 + 0.054323\,b\,M^2 + \frac{M^2}{3}$$

Alternate form assuming b, M, and V are positive:

$$V = 0.00221324\,(b + 12.2723)^2\,M^2$$

Alternate form assuming b, M, and V are real:

$$V = 0.00221324\,b^2\,M^2 + 0.054323\,b\,M^2 + 0.333333\,M^2 + 0$$

Derivative:

$$\frac{\partial}{\partial b}\left(\frac{1}{3}\,(0.0814845\,b + 1)^2\,M^2\right) = 0.054323\,(0.0814845\,b + 1)\,M^2$$

Implicit derivatives

$$\frac{\partial b(M, V)}{\partial V} = \frac{154\,317\,775\,011\,120\,075}{36\,961\,748\,(226\,802\,245 + 18\,480\,874\,b)\,M^2}$$

$$\frac{\partial b(M, V)}{\partial M} = -\frac{\frac{226\,802\,245}{18\,480\,874} + b}{M}$$

$$\frac{\partial M(b, V)}{\partial V} = \frac{154\,317\,775\,011\,120\,075}{2\,(226\,802\,245 + 18\,480\,874\,b)^2\,M}$$

$$\frac{\partial M(b, V)}{\partial b} = -\frac{18\,480\,874\,M}{226\,802\,245 + 18\,480\,874\,b}$$

$$\frac{\partial V(b, M)}{\partial M} = \frac{2\,(226\,802\,245 + 18\,480\,874\,b)^2\,M}{154\,317\,775\,011\,120\,075}$$

$$\frac{\partial V(b, M)}{\partial b} = \frac{36\,961\,748\,(226\,802\,245 + 18\,480\,874\,b)\,M^2}{154\,317\,775\,011\,120\,075}$$

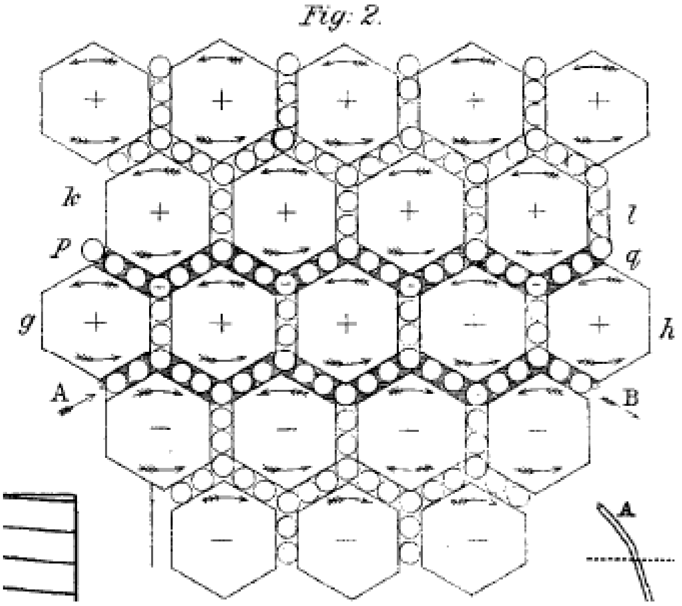
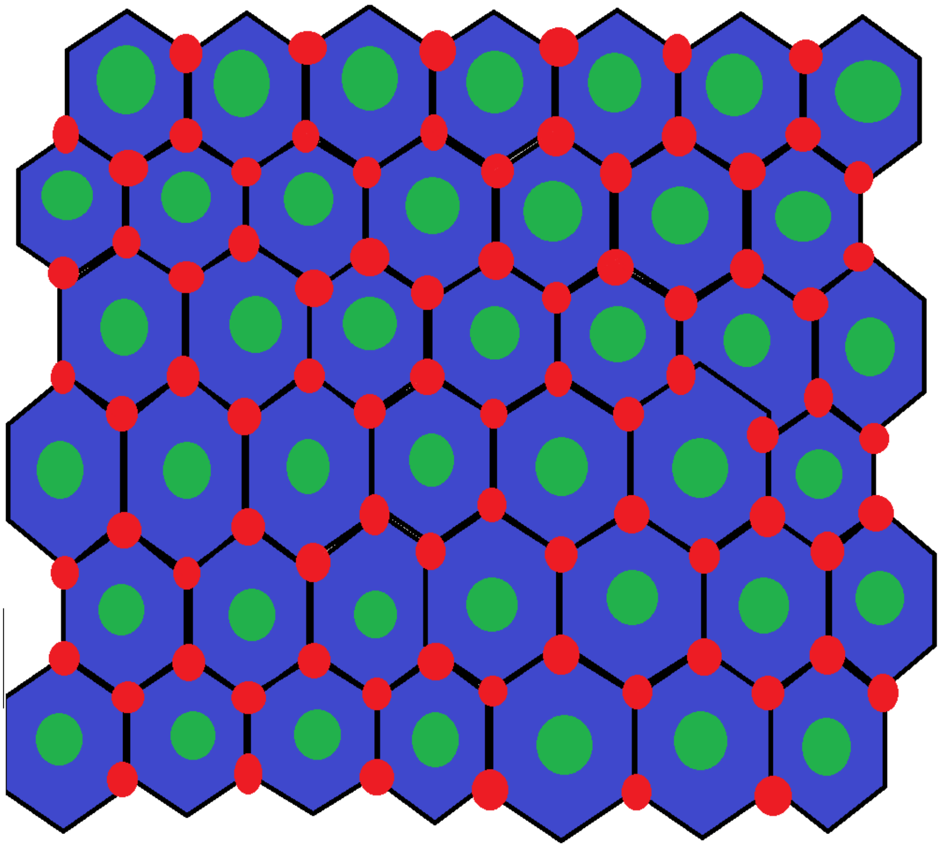
Fig. 1



It is therefore possible to consider the vortices of the "quantum vacuum" schematized as cubes or octahedrons (the + sign inside a given vortex indicates its counterclockwise rotation, while the - sign indicates its clockwise rotation). Between vortex and vortex there is a layer of "bubbles"-universes (or universes-spheres), which flows, as in the simplified two-dimensional drawing, from A to B

Fig. 2

Immagine dello Spazio-Tempo a scala quantistica: le cironferenze in rosso rappresentano i punti corrispondenti alle dimensioni compattificate e gli esagoni in blu, rappresentano le “fluttuazioni” (universi potenziali – cerchi verdi) del vuoto quantistico (2D)



Proposal

Image of space-time at quantum scale: the circles in red represent the points corresponding to the compactified dimensions and the hexagons in blue, represent the "fluctuations" (potential universes - green circles) of the quantum vacuum (2D). In reality, we will have n-dimensional hyperspheres in which the compactified dimensions "roll up" and octahedrons representing the "fluctuations", containing spheres (bubbles of potential universes), of the quantum vacuum

Acknowledgments

We would like to thank Professor **Augusto Sagnotti** theoretical physicist at Scuola Normale Superiore (Pisa – Italy) for his very useful explanations and his availability.

Abstract

In this paper (part II), we analyze some equations concerning the Ramanujan's Last Letter to Hardy. We obtain new possible mathematical connections with DN Constant, Ramanujan Recurring Numbers and some parameters of Number Theory, Theoretical Cosmology and String Theory

14.2 The Last Letter

S. Ramanujan to G. H. Hardy

12 January 1920

University of Madras

I am extremely sorry for not writing you a single letter up to now ... I discovered very interesting functions recently which I call "Mock" ϑ-functions. Unlike the "False" ϑ-functions (studied partially by Prof. Rogers in his interesting paper) they enter into mathematics as beautifully as the ordinary ϑ-functions. I am sending you with this letter some examples ....

If we consider a ϑ-function in the transformed Eulerian form e.g.

$$\text{(A)} \quad 1+\frac{q}{(1-q)^2}+\frac{q^4}{(1-q)^2(1-q^2)^2}+\frac{q^9}{(1-q)^2(1-q^2)^2(1-q^3)^2}+\cdots$$

$$\text{(B)} \quad 1+\frac{q}{1-q}+\frac{q^4}{(1-q)(1-q^2)}+\frac{q^9}{(1-q)(1-q^2)(1-q^3)}+\cdots$$

and determine the nature of the singularities at the points $q=1, q^2=1, q^3=1, q^4=1, q^5=1, \ldots$ we know how beautifully the asymptotic form of the function can be expressed in a very neat and closed exponential form. For instance when $q=e^{-t}$ and $t\to 0$

$$\text{(A)} = \sqrt{\frac{t}{2\pi}}\exp\left(\frac{\pi^2}{6t}-\frac{t}{24}\right) * + o(1)\dagger$$

$$\text{(B)} = \frac{\exp\left(\frac{\pi^2}{15t}-\frac{t}{60}\right)}{\sqrt{\frac{5-\sqrt{5}}{2}}} * + o(1)\dagger$$

and similar results at other singularities.* It is not necessary that there should be only one term like this. There may be many terms but the number of terms must be finite.† Also $o(1)$ may turn out to be $O(1)$. That is all. For instance when $q\to 1$ the function

$$\frac{1}{\{(1-q)(1-q^2)(1-q^3)\cdots\}^{120}}$$

is equivalent to the sum of five terms like (*) together with $O(1)$ instead of $o(1)$.

If we take a number of functions like (A) and (B) it is only in a limited number of cases the terms close as above; but in the majority of cases they never close as above. For instance when $q=e^{-t}$ and $t\to 0$

$$\text{(C)}\quad 1+\frac{q}{(1-q)^2}+\frac{q^3}{(1-q)^2(1-q^2)^2}+\frac{q^6}{(1-q)^2(1-q^2)^2(1-q^3)^2}+\cdots$$
$$=\sqrt{\frac{t}{2\sqrt{5}}}\exp\left(\frac{\pi^2}{5t}+a_1t+a_2t^2+\cdots+O(a_kt^k)\right)$$

where $a_1=\dfrac{1}{8\sqrt{5}}$ and so on. The function (C) is a simple example of a function behaving in an unclosed form at the singularities.

*The coefficient (of) $1/t$ in the index of e happens to be $\frac{\pi^2}{5}$ in this particular case. It may be some other transcendental numbers in other cases.

†The coefficients of $t, t^2, \ldots$ happen to be $\dfrac{1}{8\sqrt{5}}, \ldots$ in this case. In other cases they may turn out to be some other algebraic numbers.

…….

I have proved that if

$$f_3(q)=1+\frac{q}{(1+q)^2}+\frac{q^4}{(1+q)^2(1+q^2)^2}+\cdots$$

then

$$f_3(q)+(1-q)(1-q^3)(1-q^5)\cdots(1-2q+2q^4-2q^9+\cdots)=O(1)$$

at all the points $q=-1$, $q^3=-1$, $q^5=-1$, $q^7=-1$, …, and at the same time

$$f_3(q)-(1-q)(1-q^3)(1-q^5)\cdots(1-2q+2q^4-\cdots)=O(1)$$

at all the points $q^2=-1$, $q^4=-1$, $q^6=-1$, …. Also obviously $f_3(q)=O(1)$ at all the points $q=1$, $q^3=1$, $q^5=1$, …. And so $f_3(q)$ is a Mock ϑ function. When $q=-e^{-t}$ and $t\to 0$

$$f_3(q)+\sqrt{\frac{\pi}{t}}\exp\left(\frac{\pi^2}{24t}-\frac{t}{24}\right)\to 4. \qquad (14.2.1)$$

…………………………………..

The coefficient of q^n in $f_3(q)$ is

$$(-1)^{n-1}\frac{\exp\left(\pi\sqrt{\frac{n}{6}-\frac{1}{144}}\right)}{2\sqrt{n-\frac{1}{24}}}+O\left(\frac{\exp\left(\frac{1}{2}\pi\sqrt{\frac{n}{6}-\frac{1}{144}}\right)}{2\sqrt{n-\frac{1}{24}}}\right).$$

It is inconceivable that a simple ϑ function could be found to cut out the singularities of $f_3(q)$.

Mock ϑ-functions

$$\phi_3(q)=1+\frac{q}{1+q^2}+\frac{q^4}{(1+q^2)(1+q^4)}+\cdots$$

$$\psi_3(q)=\frac{q}{1-q}+\frac{q^4}{(1-q)(1-q^3)}+\frac{q^9}{(1-q)(1-q^3)(1-q^5)}+\cdots$$

$$\chi_3(q)=1+\frac{q}{1-q+q^2}+\frac{q^4}{(1-q+q^2)(1-q^2+q^4)}+\cdots$$

These are related to $f_3(q)$ as shown below.

$$\begin{aligned}2\phi_3(-q)-f_3(q)&=f_3(q)+4\psi_3(-q)\\&=\frac{1-2q+2q^4-2q^9+\cdots}{(1+q)(1+q^2)(1+q^3)\cdots}\end{aligned}$$

$$4\chi_3(q)-f_3(q)=\frac{(1-2q^3+2q^{12}+\cdots)^2}{(1-q)(1-q^2)(1-q^3)\cdots}$$

These are of the 3rd order.

……………………………………………

Mock ϑ-functions (of 7th order)

$$\text{(i)}\quad 1+\frac{q}{1-q^2}+\frac{q^4}{(1-q^3)(1-q^4)}+\frac{q^9}{(1-q^4)(1-q^5)(1-q^6)}+\cdots$$

$$\text{(ii)}\quad \frac{q}{1-q}+\frac{q^4}{(1-q^2)(1-q^3)}+\frac{q^9}{(1-q^3)(1-q^4)(1-q^5)}+\cdots$$

$$\text{(iii)}\quad \frac{1}{1-q}+\frac{q^2}{(1-q^2)(1-q^3)}+\frac{q^6}{(1-q^3)(1-q^4)(1-q^5)}+\cdots$$

These are not related to each other.

Ever yours sincerely
S. Ramanujan

Now, if we take the value of the following Rogers-Ramanujan continued fraction:

$$\frac{e^{-\frac{2\pi}{5}}}{\sqrt{\varphi\sqrt{5}-\varphi}}=1+\cfrac{e^{-2\pi}}{1+\cfrac{e^{-4\pi}}{1+\cfrac{e^{-6\pi}}{1+\cfrac{e^{-8\pi}}{1+\ldots}}}}\approx 1.0018674362$$

And the two previous values: $a_1=\frac{1}{8\sqrt{5}}$ and $\frac{\pi^2}{5}$, we get the following interesting expression, considering t = (2√2)/π) = DN Constant (Del Gaudio-Nardelli Constant):

1.0018674362+1/(((pi^2/5 -1/(8√5))/2)×1/((2√2)/π))^7

Input interpretation

$$1.0018674362+\frac{1}{\left(\left(\frac{1}{2}\left(\frac{\pi^2}{5}-\frac{1}{8\sqrt{5}}\right)\right)\times\frac{1}{\frac{2\sqrt{2}}{\pi}}\right)^7}$$

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x \rfloor$ is the floor function

i is the imaginary unit

Furthermore, if we take:

$$f_3(q) + \sqrt{\frac{\pi}{t}} \exp\left(\frac{\pi^2}{24t} - \frac{t}{24}\right) \to 4.$$

and

$$f_3(q) = 1 + \frac{q}{(1+q)^2} + \frac{q^4}{(1+q)^2(1+q^2)^2} + \cdots$$

we obtain, for q = -e^((-(2√2)/Pi))

1+e^((-2√2)/Pi)/(1+e^((-2√2)/Pi))^2 + (-e^(-(2√2)/Pi))^4/((1+e^((-2√2)/Pi))^2(1+e^((-2√2)/Pi)^2))^2+sqrt(Pi/((2√2)/Pi)) exp((Pi^2)/24*((2√2)/Pi)-((2√2)/Pi)/24)

Input

$$1+\frac{e^{(-2\sqrt{2})/\pi}}{\left(1+e^{(-2\sqrt{2})/\pi}\right)^2}+\frac{\left(-e^{-(2\sqrt{2})/\pi}\right)^4}{\left(\left(1+e^{(-2\sqrt{2})/\pi}\right)^2\left(1+e^{((-2\sqrt{2})/\pi)^2}\right)\right)^2}+\sqrt{\frac{\pi}{\frac{2\sqrt{2}}{\pi}}}\exp\left(\frac{\pi^2}{24}\times\frac{2\sqrt{2}}{\pi}-\frac{1}{24}\times\frac{2\sqrt{2}}{\pi}\right)$$

Exact result

$$1+\frac{e^{-(8\sqrt{2})/\pi}}{\left(1+e^{8/\pi^2}\right)^2\left(1+e^{-(2\sqrt{2})/\pi}\right)^4}+\frac{e^{-(2\sqrt{2})/\pi}}{\left(1+e^{-(2\sqrt{2})/\pi}\right)^2}+\frac{e^{\pi/(6\sqrt{2})-1/(6\sqrt{2}\,\pi)}\,\pi}{2^{3/4}}$$

...

4095.984583586…. ≈ 4096

The number 4096 = 64^2, is the Ramanujan Recurring Number, that when multiplied by 2 give 8192. The total amplitude vanishes for gauge group SO(8192) for bosonic string SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). This could be the implications for a pre-big bang scenario where only self-perturbative bosonic strings lived when the enthalpy was extremely low as discussed above. This regime contains all the intrinsic properties of superstrings inherent in the bosonic strings, would at the big bang give effect to the properties of matter (fermions) as Higgs Boson. This number theoretic connection to the gauge group SO(8192), gives a much more compelling relevance of the bosonic string theory SO(8192), to quantum gravity and places this string theory where it should appropriately be in the evolution of the universe from a quantum gravity perspective rather than it be neglected because it doesn't include fermionic strings to confirm to post big-bang reality.

The vanishing of the bosonic string's amplitude could be explained by the effect of extreme low entropy on the quantum vacuum geometry. Thus, as the entropy increases infinitesimally as a result of the vacuum self-perturbation then also is the amplitude of the vibrating bosonic strings from zero. Thus, was right to indicate that the "vanishing of the amplitude of the bosonic string could be the results of string theory itself", but here, we give a much more elaborate explanation of what could be happening.

1728.99674809714944460133704488922715648687035066703773788887875868

…

1728.996748….

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve $1728 = 8^2 \times 3^3$.

The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways $10^3 + 9^3 = 12^3 + 1^3 = 1729$ and Ramanujan's recurring number). Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string. Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron. As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string. That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2. Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after? That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

(27*sqrt((1+e^((-2√2)/Pi)/(1+e^((-2√2)/Pi))^2 + (-e^(-(2√2)/Pi))^4/((1+e^((-2√2)/Pi))^2(1+e^((-2√2)/Pi)^2))^2+sqrt(Pi/((2√2)/Pi)) exp((Pi^2)/24*((2√2)/Pi)-((2√2)/Pi)/24)+MRB const)^6+Pi+φ/4)+1)^1/15

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x \rfloor$ is the floor function

i is the imaginary unit

And:

(3(1 + e^((2 √(2))/π)/(1 - e^((4 √(2))/π))+e^((6√(2))/π)/(-1 + e^((8√(2))/π) + e^((14√(2))/π))-e^((12√(2))/π)/((e^((8√(2))/π)-1)(1+e^((10√(2))/π)) (e^((12√(2))/π) - 1))))1/10^35

Input

$$\left(3\left(1+\frac{e^{(2\sqrt{2})/\pi}}{1-e^{(4\sqrt{2})/\pi}}+\frac{e^{(6\sqrt{2})/\pi}}{-1+e^{(8\sqrt{2})/\pi}+e^{(14\sqrt{2})/\pi}}-\frac{e^{(12\sqrt{2})/\pi}}{\left(e^{(8\sqrt{2})/\pi}-1\right)\left(1+e^{(10\sqrt{2})/\pi}\right)\left(e^{(12\sqrt{2})/\pi}-1\right)}\right)\right)\times\frac{1}{10^{35}}$$

Exact result

$$\frac{3\left(1+\frac{e^{(2\sqrt{2})/\pi}}{1-e^{(4\sqrt{2})/\pi}}-\frac{e^{(12\sqrt{2})/\pi}}{\left(e^{(8\sqrt{2})/\pi}-1\right)\left(1+e^{(10\sqrt{2})/\pi}\right)\left(e^{(12\sqrt{2})/\pi}-1\right)}+\frac{e^{(6\sqrt{2})/\pi}}{-1+e^{(8\sqrt{2})/\pi}+e^{(14\sqrt{2})/\pi}}\right)}{100\,000\,000\,000\,000\,000\,000\,000\,000\,000\,000\,000}$$

Decimal approximation

$1.6153138335747020110799446827193782059179452039073293515009\ldots \times 10^{-35}$

$1.6153138\ldots*10^{-35} \approx 1.616255*10^{-35}$ (Planck Length)

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x \rfloor$ is the floor function

i is the imaginary unit

Thus, we obtain:

1/(1 + e^((2 sqrt(2))/π)) + e^((2 sqrt(2))/π)/((1 + e^((4 sqrt(2))/π)) (1 + e^((6 sqrt(2))/π)))-e^((6 sqrt(2))/π)/((1 + e^((6 sqrt(2))/π)) (1 + e^((8 sqrt(2))/π)) (1 + e^((10 sqrt(2))/π)))

Input

$$\frac{1}{1+e^{(2\sqrt{2})/\pi}}+\frac{e^{(2\sqrt{2})/\pi}}{\left(1+e^{(4\sqrt{2})/\pi}\right)\left(1+e^{(6\sqrt{2})/\pi}\right)}-\frac{e^{(6\sqrt{2})/\pi}}{\left(1+e^{(6\sqrt{2})/\pi}\right)\left(1+e^{(8\sqrt{2})/\pi}\right)\left(1+e^{(10\sqrt{2})/\pi}\right)}$$

for (not ($z_0 \in \mathbb{R}$ and $-\infty < z_0 \leq 0$))

Now, we analyze:

$$f_3(q) = 1 + \frac{q}{(1+q)^2} + \frac{q^4}{(1+q)^2(1+q^2)^2} + \cdots$$

The coefficient of q^n in $f_3(q)$ is

$$(-1)^{n-1}\frac{\exp\left(\pi\sqrt{\frac{n}{6}-\frac{1}{144}}\right)}{2\sqrt{n-\frac{1}{24}}} + O\left(\frac{\exp\left(\frac{1}{2}\pi\sqrt{\frac{n}{6}-\frac{1}{144}}\right)}{2\sqrt{n-\frac{1}{24}}}\right).$$

We consider, for n = 1:

(exp(π*sqrt(1/6-1/144)))/(2*sqrt(1-1/24))+(((exp(Pi/2*sqrt(1/6-1/144))/(2*sqrt(1-1/24)))))

Input

$$\frac{\exp\left(\pi\sqrt{\frac{1}{6}-\frac{1}{144}}\right)}{2\sqrt{1-\frac{1}{24}}} + \frac{\exp\left(\frac{\pi}{2}\sqrt{\frac{1}{6}-\frac{1}{144}}\right)}{2\sqrt{1-\frac{1}{24}}}$$

Exact result

$$\sqrt{\frac{6}{23}}\, e^{(\sqrt{23}\,\pi)/24} + \sqrt{\frac{6}{23}}\, e^{(\sqrt{23}\,\pi)/12}$$

Decimal approximation

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x \rfloor$ is the floor function

i is the imaginary unit

From which, after some calculations:

1/6(√6(sqrt(6/23)e^((sqrt(23) π)/24)+sqrt(6/23)e^((sqrt(23) π)/12))+(sqrt(6/47)e^((sqrt(47) π)/24)-sqrt(6/47) e^((sqrt(47) π)/12))+(sqrt(6/95) e^((sqrt(95) π)/24) - sqrt(6/95) e^((sqrt(95) π)/12)))^2

Input

$$\frac{1}{6}\left(\sqrt{6}\left(\sqrt{\frac{6}{23}}\, e^{1/24\left(\sqrt{23}\,\pi\right)}+\sqrt{\frac{6}{23}}\, e^{1/12\left(\sqrt{23}\,\pi\right)}\right)+\left(\sqrt{\frac{6}{47}}\, e^{1/24\left(\sqrt{47}\,\pi\right)}-\sqrt{\frac{6}{47}}\, e^{1/12\left(\sqrt{47}\,\pi\right)}\right)+\left(\sqrt{\frac{6}{95}}\, e^{1/24\left(\sqrt{95}\,\pi\right)}-\sqrt{\frac{6}{95}}\, e^{1/12\left(\sqrt{95}\,\pi\right)}\right)\right)^2$$

Result

$$\frac{1}{6}\left(\sqrt{\frac{6}{47}}\, e^{\left(\sqrt{47}\,\pi\right)/24}-\sqrt{\frac{6}{47}}\, e^{\left(\sqrt{47}\,\pi\right)/12}+\sqrt{\frac{6}{95}}\, e^{\left(\sqrt{95}\,\pi\right)/24}-\sqrt{\frac{6}{95}}\, e^{\left(\sqrt{95}\,\pi\right)/12}+\sqrt{6}\left(\sqrt{\frac{6}{23}}\, e^{\left(\sqrt{23}\,\pi\right)/24}+\sqrt{\frac{6}{23}}\, e^{\left(\sqrt{23}\,\pi\right)/12}\right)\right)^2$$

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x \rfloor$ is the floor function

i is the imaginary unit

From the difference between the previous exact results, after some calculations, we obtain:

√(1/2(1/e((√(6/23) e^((√(23) π)/24)+√(6/23) e^((√(23) π)/12))-(√(6/47) e^((√(47) π)/24)-√(6/47) e^((√(47) π)/12))-(√(6/95) e^((√(95)π)/24)-√(6/95) e^((√(95) π)/12))))^2)

Input

$$\sqrt{\left(\frac{1}{2}\left(\frac{1}{e}\left(\left(\sqrt{\frac{6}{23}}\, e^{1/24\left(\sqrt{23}\,\pi\right)}+\sqrt{\frac{6}{23}}\, e^{1/12\left(\sqrt{23}\,\pi\right)}\right)-\left(\sqrt{\frac{6}{47}}\, e^{1/24\left(\sqrt{47}\,\pi\right)}-\sqrt{\frac{6}{47}}\, e^{1/12\left(\sqrt{47}\,\pi\right)}\right)-\left(\sqrt{\frac{6}{95}}\, e^{1/24\left(\sqrt{95}\,\pi\right)}-\sqrt{\frac{6}{95}}\, e^{1/12\left(\sqrt{95}\,\pi\right)}\right)\right)\right)^2\right)}$$

Exact result

$$\frac{1}{\sqrt{2}\, e}\left(\sqrt{\frac{6}{23}}\, e^{\left(\sqrt{23}\,\pi\right)/24}+\sqrt{\frac{6}{23}}\, e^{\left(\sqrt{23}\,\pi\right)/12}-\sqrt{\frac{6}{47}}\, e^{\left(\sqrt{47}\,\pi\right)/24}+\sqrt{\frac{6}{47}}\, e^{\left(\sqrt{47}\,\pi\right)/12}-\sqrt{\frac{6}{95}}\, e^{\left(\sqrt{95}\,\pi\right)/24}+\sqrt{\frac{6}{95}}\, e^{\left(\sqrt{95}\,\pi\right)/12}\right)$$

4095.9804555682368728953861095011390067370487983704360553363638761

...

4095.9804555682…. ≈ 4096

The number 4096 = 64^2, is the Ramanujan Recurring Number, that when multiplied by 2 give 8192. The total amplitude vanishes for gauge group SO(8192) for bosonic string SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). This could be the implications for a pre-big bang scenario where only self-perturbative bosonic strings lived when the enthalpy was extremely low as discussed above. This regime contains all the intrinsic properties of superstrings inherent in the bosonic strings, would at the big bang give effect to the properties of matter (fermions) as Higgs Boson. This number theoretic connection to the gauge group SO(8192), gives a much more compelling relevance of the bosonic string theory SO(8192), to quantum gravity and places this string theory where it should appropriately be in the evolution of the universe from a quantum gravity perspective rather than it be neglected because it doesn't include fermionic strings to confirm to post big-bang reality. The vanishing of the bosonic string's amplitude could be explained by the effect of extreme low entropy on the quantum vacuum geometry. Thus, as the entropy increases infinitesimally as a result of the vacuum self-perturbation then also is the amplitude of the vibrating bosonic strings from zero. Thus, was right to indicate that the "vanishing of the amplitude of the bosonic string could be the results of string theory itself", but here, we give a much more elaborate explanation of what could be happening.

27*sqrt((((((((1/2 (-1 - sqrt(5)) + sqrt(1/2 (5 + sqrt(5)))) e^((2 π)/5))+(((1/2 (1 - sqrt(5)) + sqrt(1/2 (5 - sqrt(5)))) e^(π/5))))))^(11+Φ)+55+11+Φ)+1

Input

$$27\sqrt{\left(\left(\left(\frac{1}{2}\left(-1-\sqrt{5}\right)+\sqrt{\frac{1}{2}\left(5+\sqrt{5}\right)}\right)e^{(2\pi)/5}+\left(\frac{1}{2}\left(1-\sqrt{5}\right)+\sqrt{\frac{1}{2}\left(5-\sqrt{5}\right)}\right)e^{\pi/5}\right)^{11+\Phi}+55+11+\Phi\right)}+1$$

1728.9958773415070507208477003022035254927601595197000041256414725…

1728.9958773415….

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve $1728 = 8^2 \times 3^3$. The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways $10^3 + 9^3 = 12^3 + 1^3 = 1729$ and Ramanujan's recurring number). Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string. Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron. As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string. That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2. Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after? That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

(27*sqrt(((((((1/2 (-1 - sqrt(5)) + sqrt(1/2 (5 + sqrt(5)))) e^((2 π)/5))+(((1/2 (1 - sqrt(5)) + sqrt(1/2 (5 - sqrt(5)))) e^(π/5))))))^(11+Φ)+55+11+Φ)+1)^1/15+(MRB const)^(1-1/(4π)+π)

...

1.6449377628…. ≈ ζ(2) = $\pi^2/6$ = 1.644934 (trace of the instanton shape and Ramanujan Recurring Number)

Observations

Regarding the connection between Ramanujan's "Mock theta functions", the DN Constant and Ramanujan's recurring numbers, we analyzed the first three third-order mock theta functions.

$$\phi_3(q) = 1 + \frac{q}{1+q^2} + \frac{q^4}{(1+q^2)(1+q^4)} + \cdots$$

$$\psi_3(q) = \frac{q}{1-q} + \frac{q^4}{(1-q)(1-q^3)} + \frac{q^9}{(1-q)(1-q^3)(1-q^5)} + \cdots$$

$$\chi_3(q) = 1 + \frac{q}{1-q+q^2} + \frac{q^4}{(1-q+q^2)(1-q^2+q^4)} + \cdots$$

We obtained the following results by setting q = (-e^(-(2√2)/π)), where ((2√2)/π) is the DN Constant: for the first 1.649348428…. ≈ ζ(2) = $\pi^2/6$, a value close to ζ(2) and 1.6141822827…. close to the value of the golden ratio. For the second: 1.614327190536…. a result close to the value of the golden ratio. For the third: 1.65657223 and 1.61343886798155…. results close to the values of ζ(2) and the golden ratio, respectively. What could this indicate from a geometric, physical and cosmological point of view?

The results obtained from the analysis of the first three third-order Mock theta functions are truly fascinating. The connections with $\zeta(2) = \pi^2/6 = 1.644934…$and the golden ratio $(\sqrt{5}+1)/2 = 1.61803398…$ suggest several interesting implications from a geometric, physical and cosmological point of view:

1. **Geometric**:

- Symmetries and Shapes: The connections with π and the golden ratio indicate that Mock theta functions could be linked to fundamental symmetries and geometric shapes present in the universe. The golden ratio, in particular, is known to appear in many natural structures and could suggest an intrinsic geometry of the universe.

- Fractal Structures: Theta functions and their variants, such as Mock theta functions, often exhibit fractal properties. This could indicate that cosmic-scale structures could have a fractal nature.

2 **Physics**:

- Universal Constants: The closeness of the obtained values to ζ(2) and the golden ratio could suggest that these mathematical constants are fundamental to describe the physical laws of the universe. They could be indicative of new physical constants emerging from deep mathematical principles.

- String Theory: Connections with Mock theta functions could have implications for string theory, where modular functions and their generalizations play a crucial role. This could lead to new insights into string vibrations and extra dimensions.

3. **Cosmology**:

- Inflation and Symmetry: Our proposal, based on the DN Constant on eternal inflation and symmetry breaking, could be further supported by these connections. Mock theta functions could describe phase transitions in the early universe, where symmetries break and entropy increases.

- Origin of the Universe: Connections with ζ(2) and the golden ratio may suggest that the universe has an underlying mathematical structure that governs its evolution. This could provide new insights into the origin and structure of the universe.

These are just some of the possible implications. Continuing to explore these connections could lead to significant discoveries and a deeper understanding of the fundamental laws that govern the universe. Such work promises to open new avenues in theoretical physics and mathematics.

“Mock theta functions” could describe phase transitions in the early universe, where symmetries break and entropy increases. Let’s explain this statement in more detail

Phase Transitions in the Early Universe

1. **What is a Phase Transition**?

- A phase transition is a change in state of matter that occurs when physical conditions, such as temperature or pressure, exceed a certain threshold. A common example is the transition of water from liquid to solid (ice) or gas (steam).

2. **Cosmological Phase Transitions**:

- In the early universe, several phase transitions are believed to have occurred. These transitions played a crucial role in the formation of cosmic structures and in defining the physical laws we observe today.

- An example is the phase transition associated with the breaking of electroweak symmetry, which separated the electromagnetic force from the weak force.

Role of Mock Theta Functions

1. **Mathematical Description of Phase Transitions**:

- Ramanujan’s mock theta functions, with their unique properties, can be used to mathematically describe phase transitions. These functions can model how symmetries break and how entropy increases during these transitions.

- The modular properties of mock theta functions can be particularly useful for describing the symmetry changes and quantum fluctuations that occur during phase transitions.

2. **Symmetry Breaking**:

- During a phase transition, the initial symmetries of the universe can break, leading to the formation of new physical structures and laws. Mock theta functions can help model this symmetry breaking process.

- For example, the Riemann zeta function and other modular functions have been used to describe the distribution of energy states in physical systems. Mock theta functions could play a similar role in the context of cosmological phase transitions.

3. **Increase in Entropy**:

- Entropy is a measure of disorder or randomness in a system. During a phase transition, entropy tends to increase as the system goes from a state of high symmetry to a state of low symmetry.

- Mock theta functions can be used to describe how entropy changes during these transitions, providing a deeper understanding of thermodynamic processes in the early universe.

Cosmological Implications

• **Formation of Cosmic Structures**:

o Understanding phase transitions in the early universe can help explain the formation of cosmic structures, such as galaxies and galaxy clusters.

• **Origin of Physical Constants**:

o Connections between mock theta functions and fundamental physical constants could provide new insights into the origin and nature of these constants.

In summary, Ramanujan's mock theta functions offer a powerful mathematical tool to model phase transitions in the early universe, helping us better understand the processes of symmetry breaking and entropy increase that shaped the universe as we know it today.

Regarding the effect of mock theta functions, with the connections found, on quantum gravity, we note that Ramanujan's "Mock theta functions", with their connections to fundamental mathematical constants such as zeta(2) = π2/6 and the golden ratio, could have significant implications for quantum gravity. Here are some possible directions in which these connections could influence our understanding of quantum gravity:

1. **Quantum Vacuum Structure**:

- Mock theta functions could provide a more precise mathematical description of the quantum vacuum, which is central to quantum gravity. The structure of the quantum vacuum is crucial to understanding phenomena such as particle creation and quantum fluctuations1.

2. **String Theory**:

- In string theory, modular functions and their generalizations, such as mock theta functions, play an important role. These functions could help describe string vibrations and extra dimensions, offering new insights into the fundamental structure of space-time.

3. **Phase Transitions and Symmetry Breaking**:

- As mentioned above, mock theta functions could describe phase transitions in the early universe, where symmetries break and entropy increases. These processes are relevant to quantum gravity, as they influence the formation of cosmic structures and the dynamics of space-time.

4 . **Quantum Invariants**:

- Mock theta functions have also been studied as quantum invariants in various mathematical and physical contexts. These invariants could provide new insights into the quantum properties of space-time and gravitational interactions.

5. **New Physical Constants**:

Connections between mock theta functions and fundamental mathematical constants could suggest the existence of new physical constants that emerge from deep mathematical principles. These new constants could be crucial for a coherent theory of quantum gravity.

In summary, Ramanujan’s mock theta functions could offer new mathematical and conceptual tools to address some of the most difficult challenges in quantum gravity. Continuing to explore these connections could lead to significant discoveries and a deeper understanding of the fundamental laws that govern the universe.

On the application of the formulas of the volumes of an octahedron and a sphere

With regard to a sphere inscribed in an octahedron, we have the following formulas.

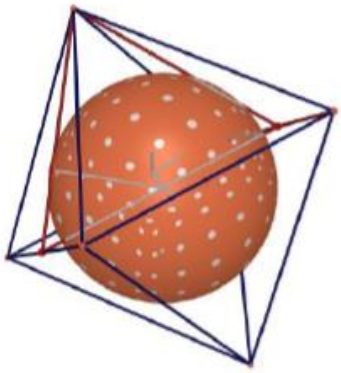

Fig: sphere inscribed in an octahedron

$V_0 = \frac{1}{3}\sqrt{2}\, l^3$

$V_s = \frac{4}{3}\pi r^3$; where $r_s = (l/2)$

With regard the ratio between the two above formulas (octahedron and sphere)

(1/3*√2*l^3)/(4/3*π*(l/2)^3)

we obtain:

Input

$$\frac{\frac{1}{3}\sqrt{2}\, l^3}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^3}$$

Result

$$\frac{\sqrt{2}\ 2}{\pi} \quad \text{(for } l \neq 0\text{)}$$

for ($x \in \mathbb{R}$ and $x < 0$)

$$\frac{\left(2\pi\sqrt{2}\right)\left(\sqrt{2}\,l^3\right)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3} =$$

$$4\left(\frac{1}{z_0}\right)^{\lfloor\arg(2-z_0)/(2\pi)\rfloor} z_0^{1+\lfloor\arg(2-z_0)/(2\pi)\rfloor}\left(\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k (2-z_0)^k z_0^{-k}}{k!}\right)^2$$

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x\rfloor$ is the floor function

i is the imaginary unit

6π*√2((1/3*√2*l^3)/(4/3*π*(l/2)^3))

Input

$$6\pi\sqrt{2}\times\frac{\frac{1}{3}\sqrt{2}\,l^3}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^3}$$

Exact result

24

24

The value 24 is linked to the "Ramanujan function" (an elliptic modular function that satisfies the need for "conformal symmetry") that has 24 "modes" corresponding to the physical vibrations of a bosonic string representing a bosons. From the analysis, we observe that the is no number theoretic connection with physical vibrations of fermionic strings at extremally low entropy. This fact is confirmed by the fact that the Higgs bosons at the moment of the big bang and infinitesimally shortly thereafter, facilitated the creation of fermions (matter and antimatter particles) [8]. Thus we note that the ingredients for the formation of electromagnetic radiation from photons (a Boson), and the formation of matter from the Higgs boson after the big bang, are intrinsic properties of the vacuum energy in pre-big bang.

Series representations

$$\frac{(6\pi\sqrt{2})(\sqrt{2}\,l^3)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3}=12\sqrt{z_0}^{\,2}\left(\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(2-z_0)^k\,z_0^{-k}}{k!}\right)^2$$

for (not ($z_0\in\mathbb{R}$ and $-\infty<z_0\leq 0$))

$$\frac{(6\pi\sqrt{2})(\sqrt{2}\,l^3)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3} = 12\exp^2\left(i\pi\left\lfloor\frac{\arg(2-x)}{2\pi}\right\rfloor\right)\sqrt{x}^2\left(\sum_{k=0}^{\infty}\frac{(-1)^k(2-x)^k x^{-k}\left(-\frac{1}{2}\right)_k}{k!}\right)^2$$

for ($x \in \mathbb{R}$ and $x < 0$)

$$\frac{(6\pi\sqrt{2})(\sqrt{2}\,l^3)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3} =$$

$$12\left(\frac{1}{z_0}\right)^{\lfloor\arg(2-z_0)/(2\pi)\rfloor} z_0^{1+\lfloor\arg(2-z_0)/(2\pi)\rfloor}\left(\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(2-z_0)^k z_0^{-k}}{k!}\right)^2$$

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x\rfloor$ is the floor function

i is the imaginary unit

This could imply that all matter (fermions) was preceded by bosons. That is, before the Big Bang, from perturbations of the vacuum energy itself, bosons were created, and successively at the Big Bang, and infinitesimally shortly after the Big Bang, fermions, were created from the vacuum energy that underwent a violent “breaking” that formed a hot plasma. of particle-antiparticle pairs. This therefore implies that quantum gravity was not necessarily “dark” to some extent, because a photon (light particle) is itself a boson. Therefore, a big bang was not necessarily the moment of the creation of light, but of the creation of matter (fermions) from vacuum energy, as this undergoes further "breaking" in the cosmological constant, in the hot plasma of matter and in the energy dark.

(2π*√2((1/3*√2*l^3)/(4/3*π*(l/2)^3)))^4

Input

$$\left(2\pi\sqrt{2}\times\frac{\frac{1}{3}\sqrt{2}\,l^3}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^3}\right)^4$$

Exact result

4096

$4096 = 64^2$, (Ramanujan Recurring Number) that multiplied by 2 give 8192, indeed:

The total amplitude vanishes for gauge group SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). (From: "Dilaton Tadpole for the Open Bosonic String " Michael R. Douglas and Benjamin Grinstein - September 2,1986)

27*sqrt((2π*√2((1/3*√2*l^3)/(4/3*π*(l/2)^3)))^4)+1

Input

$$27\sqrt{\left(2\pi\sqrt{2}\times\frac{\frac{1}{3}\sqrt{2}\,l^3}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^3}\right)^4}+1$$

Exact result

1729

1729

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve ($1728 = 8^2 * 3^3$).

The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways ($10^3 + 9^3 = 12^3 + 1^3 = 1729$) and Ramanujan's recurring number)

Series representations

$$27\sqrt{\left(\frac{\left(2\pi\sqrt{2}\right)\left(\sqrt{2}\,l^3\right)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3}\right)^4}+1=$$

Furthermore, from the formula

$$2^{-1/\pi}\sqrt[2\pi]{5\left(3+\sqrt{5}\right)\pi}$$

we obtain also:

(4 (1.6180085459)^(2 π))/(5 (3 + sqrt(5))) = 3.1415926535

Indeed:

$$\frac{4\times 1.6180085459^{2\pi}}{5\left(3+\sqrt{5}\right)}$$

3.1415926535884871624221932509858715278931025189245576170078100613
…

3.1415926535…. = π (Ramanujan Recurring Number)

From the following extended DN Constant (“Unitary Formula”)

$$\sqrt[2\pi]{\frac{\frac{5}{12}\left(3+\sqrt{5}\right)d^3}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}\times\frac{1}{\frac{\frac{1}{3}\sqrt{2}a^3}{\frac{4}{3}\pi\left(\frac{a}{2}\right)^3}}\times\frac{1}{\frac{\sqrt{2}}{12}d^3\cdot\frac{1}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}}}\times\sqrt[3]{-\frac{q}{2}+\sqrt{\frac{q^2}{4}+\frac{p^3}{27}}}+\sqrt[3]{-\frac{q}{2}-\sqrt{\frac{q^2}{4}+\frac{p^3}{27}}}$$

with regard

$$\sqrt[3]{-\frac{q}{2}+\sqrt{\frac{q^2}{4}+\frac{p^3}{27}}}+\sqrt[3]{-\frac{q}{2}-\sqrt{\frac{q^2}{4}+\frac{p^3}{27}}}$$

for q = 1729 and p = 4096, we obtain by changing the sign in the algebraic sum of the aforementioned Cardano’s Formula and after some calculations:

$$2^{-1/\pi}\sqrt[2\pi]{5\left(3+\sqrt{5}\right)\pi}$$

multiplied by

$$\sqrt[9]{\sqrt[3]{-\frac{1729}{2}+\sqrt{\frac{1729^2}{4}+\frac{4096^3}{27}}}-\sqrt[3]{-\frac{1729}{2}-\sqrt{\frac{1729^2}{4}+\frac{4096^3}{27}}}}$$

and performing the ninth root of the entire expression:

√((2^(-1/π)(5(3+√(5))π)^(1/(2π)))((∛(-1729/2+√(1729^2/4+4096^3/27)) -∛(-1729/2-√(1729^2/4+4096^3/27)))^1/9))

we obtain:

$$\sqrt{\left(\left(2^{-1/\pi}\sqrt[2\pi]{5\left(3+\sqrt{5}\right)\pi}\right)\sqrt[9]{\sqrt[3]{-\frac{1729}{2}+\sqrt{\frac{1729^2}{4}+\frac{4096^3}{27}}}-\sqrt[3]{-\frac{1729}{2}-\sqrt{\frac{1729^2}{4}+\frac{4096^3}{27}}}}\right)}$$

$$2^{-1/(2\pi)}\sqrt[18]{\sqrt[3]{\frac{\sqrt{\frac{274958621851}{3}}}{6}-\frac{1729}{2}}+\sqrt[3]{\frac{1729}{2}+\frac{\sqrt{\frac{274958621851}{3}}}{6}}}\sqrt[4\pi]{5\left(3+\sqrt{5}\right)\pi}$$

i.e.

2^(-1/(2π)) ((-1729/2+√(274958621851/3)/6)^(1/3)+(1729/2 + √(274958621851/3)/6)^(1/3))^(1/18) (5(3+√(5)) π)^(1/(4π))

= 1.61549140391….

The general "unitary" formula, which derives from DN Constant, is the following:

$$\sqrt{2\times\frac{2\cdot\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{1}{\pi\cdot 0.9991104684}\left(C\times \mathrm{R}\times 2.33\cdot 10^{-13}\right)}}\cong 1.61803398\ldots=\frac{\sqrt{5}+1}{2}$$

Where $\frac{2\sqrt{2}}{\pi}$ is the Del Gaudio-Nardelli Constant, 0.9991104684 is the value of the following Rogers-Ramanujan continued fraction:

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\frac{e^{-\pi\sqrt{5}}}{1+\frac{e^{-2\pi\sqrt{5}}}{1+\frac{e^{-3\pi\sqrt{5}}}{1+\frac{e^{-4\pi\sqrt{5}}}{1+\dots}}}}\approx 0.9991104684$$

C is any constant or solution to an equation, R is the radius of the Universe and $2.33*10^{-13}$ is the temperature of the universe expressed in GeV.

For example, C = 9.9128 , inserting a radius of the Universe, which we have calculated, equal to $R = 2.06274*10^{12}$ years, from DN Constant "unitary" formula, we obtain:

√(2×(2·(((2√2)/π))^(1/16))/(1/(π·0.9991104684) (9.9128×(2.06274 × 10^12)×2.33·10^(-13))))

$$\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{1}{\pi\times0.9991104684}\times\frac{9.9128\times2.06274\times10^{12}\times2.33}{10^{13}}}}$$

1.618035912348264235440174408834709854254527350840173356306481810 7
...

1.618035912348…. result that is a very good approximation to the value of the golden ratio 1.618033988749… (Ramanujan Recurring Number)

We obtain also:

(√(2×(2·(((2√2)/π))^(1/16))/(1/(π·0.9991104684) (9.9128×(2.06274 × 10^12)×2.33·10^(-13)))))dxdydz

Indefinite integral assuming all variables are real

$0.809018\,x^2\,y\,z + \text{constant}$

Definite integral over a cube of edge length 2 L

$$\int_{-L}^{L}\int_{-L}^{L}\int_{-L}^{L} 1.61804\,dx\,dy\,dz = 12.9443\,L^3$$

Definite integral over a sphere of radius R

$$\iiint\limits_{x^2+y^2+z^2<R^2} 1.61804\,dz\,dy\,dx = 6.77761\,R^3$$

From which, for L = R = 1 , dividing the two definite integral results by the original expression, we obtain:

12.9443/(√(2×(2·(((2√2)/π))^(1/16))/(1/(π·0.9991104684) (9.9128×(2.06274 × 10^12)×2.33·10^(-13)))))

Input interpretation

$$\frac{12.9443}{\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{1}{\pi\times 0.9991104684}\times\frac{9.9128\times 2.06274\times 10^{12}\times 2.33}{10^{13}}}}}$$

New fundamental formula deriving from DN Constant

The DN Constant (Del Gaudio-Nardelli Constant) equals (2√2)/π) is defined as the ratio of the volume of an octahedron to the volume of a sphere and is an intriguing mathematical concept. Michele Nardelli hypothesized that the regular octahedron represents a phase in which the universe is highly symmetrical and with very low entropy. On the other hand, the sphere (which is inscribed in the octahedron, i.e. is "inside" it) represents the universe emerging from the quantum vacuum, which over time increases entropy and undergoes various symmetry breakings. This occurs in a regime of eternal inflation.

From the following expression

√(2×(2·(((2√2)/π)^(1/16)))/(4096/(π·0.9991104684) (((1.616255*10^-35)/(1.1056*10^-52))×C×R)))

$$\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{4096}{\pi\times0.9991104684}\left(\frac{1.616255\times10^{-35}}{1.1056\times10^{-52}}\,C\,R\right)}}$$

which comes from the DN Constant, with $1.616255*10^{-35}$ which is equal to the Planck length, $1.1056*10^{-52}$ which is equal to the Cosmological Constant, C = 1729 which corresponds to the Hardy-Ramanujan number and R = $4.6018401361 \times 10^{-24}$, which represents the radius of the Universe, we obtain:

√(2×(2·(((2√2)/π)^(1/16)))/(4096/(π·0.9991104684) (((1.616255*10^-35)/(1.1056*10^-52))×1729×4.6018401361 × 10^-24))) = 1.6180329973...

$$\sqrt{2\times\frac{2\sqrt[16]{\frac{2\sqrt{2}}{\pi}}}{\frac{4096}{\pi\times0.9991104684}\left(\frac{1.616255\times10^{-35}}{1.1056\times10^{-52}}\times1729\times4.6018401361\times10^{-24}\right)}}$$

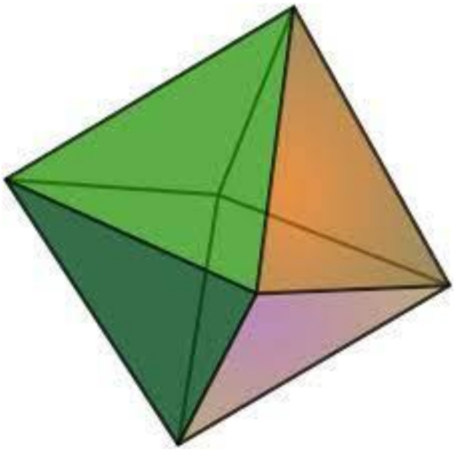
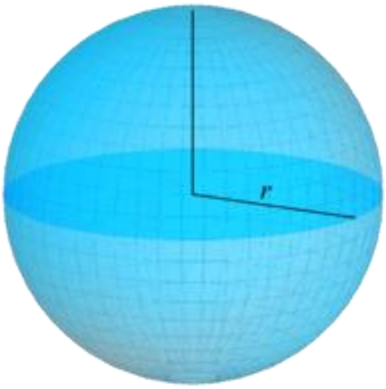
3.14159225731469…≈ π (Ramanujan Recurring Number)

Now, we have that:



Octahedron



Sphere

Given the value of a volume, independently of the solid, following the Poincaré Conjecture, we compare any solid "without holes" and a sphere. If we compare an octahedron with a sphere, we have:

$$\frac{4}{3}\pi r^3 = \frac{1}{3}\sqrt{2}a^3$$

If we consider the radius of the sphere as an unknown, we must find the value of the side of the octahedron which allows us to equalize the two volumes and which will give us the DN Constant as a result (which will therefore be equal to the radius of the sphere).

From

$$\frac{4}{3}\pi r^3 = \frac{1}{3}\sqrt{2}a^3$$

To find r we perform the following calculation:

$$r^3 = \frac{\frac{1}{3}\sqrt{2}a^3}{\frac{4}{3}\pi} = \frac{1}{3}\sqrt{2}a^3 \cdot \frac{3}{4\pi} = \frac{\sqrt{2}a^3}{4\pi} = \frac{\sqrt{2}\cdot\sqrt{2}a^3}{\sqrt{2}\cdot 4\pi} = \frac{2a^3}{\sqrt{2}\cdot 4\pi} = \frac{a^3}{2\sqrt{2}\pi}$$

$$r^3 = \frac{a^3}{2\sqrt{2}\pi}; \qquad r = \sqrt[3]{\frac{a^3}{2\sqrt{2}\pi}} = \frac{a}{\sqrt[3]{2\sqrt{2}\pi}}$$

To find a, we have, for

$$r = \frac{2\sqrt{2}}{\pi}; \qquad \frac{a}{\sqrt[3]{2\sqrt{2}\pi}} = \frac{2\sqrt{2}}{\pi};$$

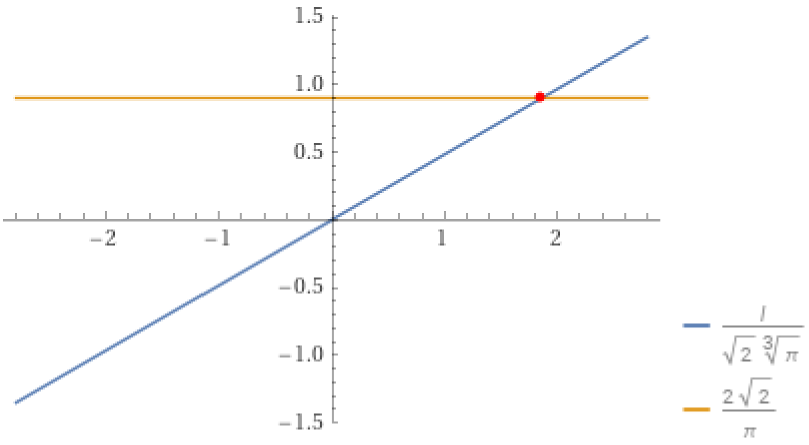
Thus, multiplying both the sides by $\sqrt[3]{2\sqrt{2}\pi}$, we obtain:

$$a = \frac{2\sqrt{2}}{\pi} \cdot \sqrt[3]{2\sqrt{2}\pi} = \sqrt[3]{\frac{\left(2\sqrt{2}\right)^3 2\sqrt{2}\pi}{\pi^3}} =$$

$$= \sqrt[3]{\frac{8\cdot\sqrt{2^3}\cdot 2\sqrt{2}}{\pi^2}} = \sqrt[3]{\frac{8\cdot\sqrt{2\cdot 2^2}\cdot 2\sqrt{2}}{\pi^2}} = \sqrt[3]{\frac{16\cdot\sqrt{2}\cdot 2\sqrt{2}}{\pi^2}}$$

$$= \sqrt[3]{\frac{32\,\sqrt{2}\sqrt{2}}{\pi^2}} = \sqrt[3]{\frac{32\ \cdot 2}{\pi^2}} = \frac{\sqrt[3]{64}}{\sqrt[3]{\pi^2}} = \frac{4}{\sqrt[3]{\pi^2}}; \ a = \frac{4}{\sqrt[3]{\pi^2}}$$

Plot



Solution

$$a = \frac{4}{\sqrt[3]{\pi^2}}$$

for V = 1/3*√2*a^3 (octahedron volume) and V = (4/3*π*r^3) (sphere volume), we obtain:

from the octahedron volume, we have: V = 1/3*√2*a^3 = (1/3*√2*($\frac{4}{\sqrt[3]{\pi^2}}$)^3)

(1/3*√2*(4/∛(π^2))^3)

Input

Property

$\frac{64\sqrt{2}}{3\pi^2}$ is a transcendental number

Series representations

$$\frac{1}{3}\left(\pi\left(\frac{2\sqrt{2}}{\pi}\right)^3\right)4 = \frac{32\sqrt{z_0}^3\left(\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(2-z_0)^k z_0^{-k}}{k!}\right)^3}{3\pi^2}$$

for (not ($z_0 \in \mathbb{R}$ and $-\infty < z_0 \leq 0$))

$$\frac{1}{3}\left(\pi\left(\frac{2\sqrt{2}}{\pi}\right)^3\right)4 = \frac{32\exp^3\left(i\,\pi\left\lfloor\frac{\arg(2-x)}{2\pi}\right\rfloor\right)\sqrt{x}^3\left(\sum_{k=0}^{\infty}\frac{(-1)^k\,(2-x)^k\,x^{-k}\left(-\frac{1}{2}\right)_k}{k!}\right)^3}{3\,\pi^2}$$

for $(x \in \mathbb{R}$ and $x < 0)$

$$\frac{1}{3}\left(\pi\left(\frac{2\sqrt{2}}{\pi}\right)^3\right)4 =$$

$$\frac{32\left(\frac{1}{z_0}\right)^{3/2\,\lfloor\arg(2-z_0)/(2\,\pi)\rfloor}\,z_0^{3/2\,(1+\lfloor\arg(2-z_0)/(2\,\pi)\rfloor)}\left(\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(2-z_0)^k\,z_0^{-k}}{k!}\right)^3}{3\,\pi^2}$$

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

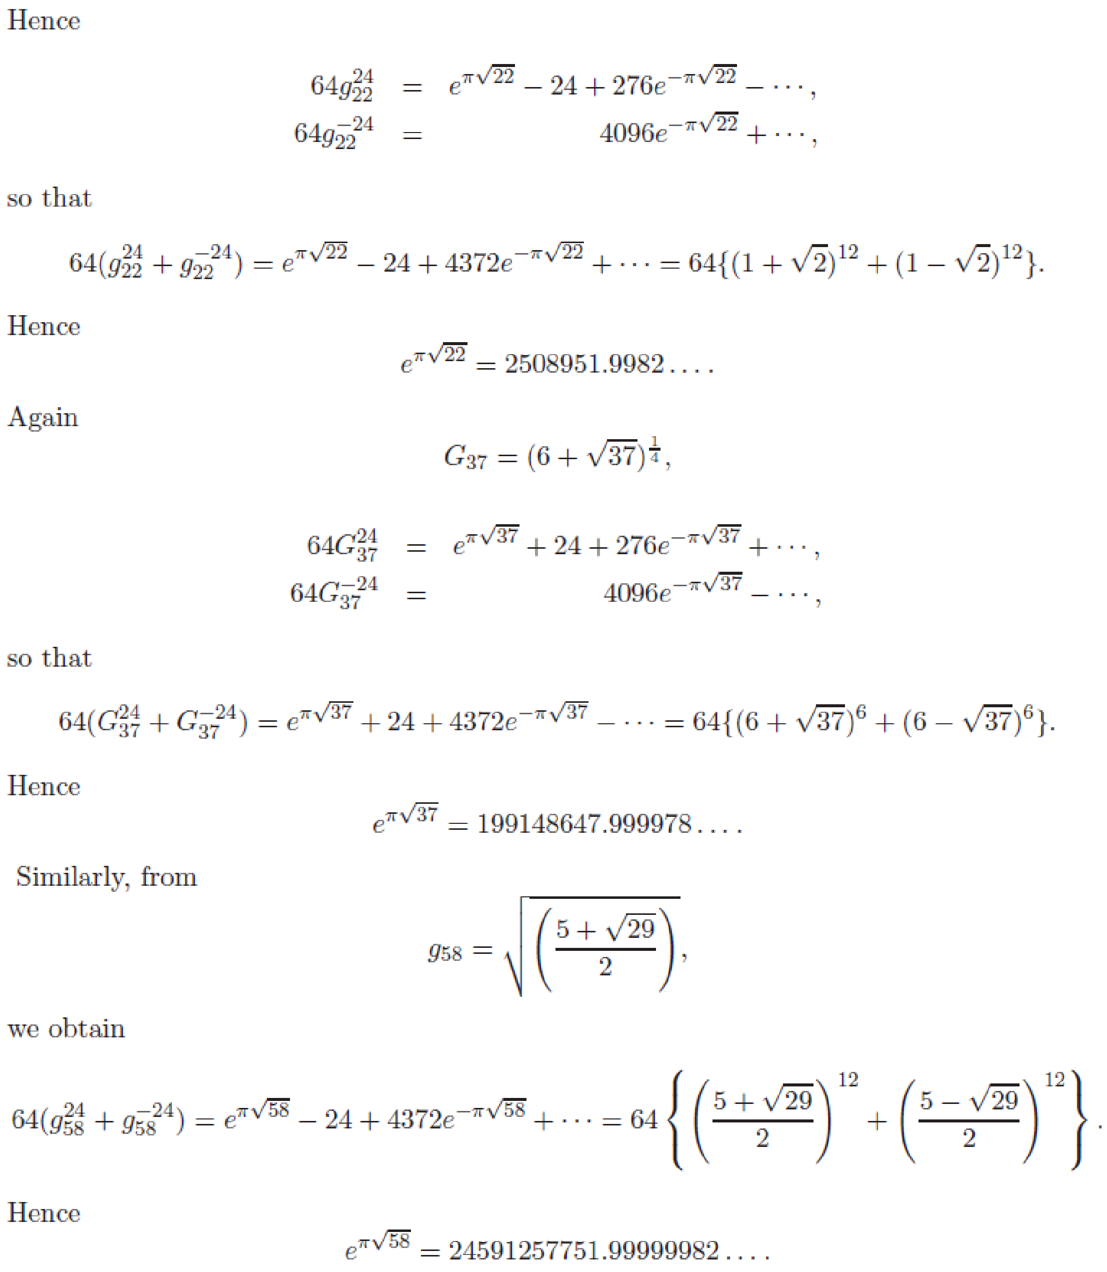
$\lfloor x \rfloor$ is the floor function

i is the imaginary unit

From:

Modular equations and approximations to π - *Srinivasa Ramanujan* - Quarterly Journal of Mathematics, XLV, 1914, 350 – 372

We have that:



Hence

$$\begin{aligned} 64g_{22}^{24} &= e^{\pi\sqrt{22}} - 24 + 276e^{-\pi\sqrt{22}} - \cdots, \\ 64g_{22}^{-24} &= 4096e^{-\pi\sqrt{22}} + \cdots, \end{aligned}$$

so that

$$64(g_{22}^{24} + g_{22}^{-24}) = e^{\pi\sqrt{22}} - 24 + 4372e^{-\pi\sqrt{22}} + \cdots = 64\{(1+\sqrt{2})^{12} + (1-\sqrt{2})^{12}\}.$$

Hence

$$e^{\pi\sqrt{22}} = 2508951.9982\ldots.$$

Again

$$G_{37} = (6+\sqrt{37})^{\frac{1}{4}},$$

$$\begin{aligned} 64G_{37}^{24} &= e^{\pi\sqrt{37}} + 24 + 276e^{-\pi\sqrt{37}} + \cdots, \\ 64G_{37}^{-24} &= 4096e^{-\pi\sqrt{37}} - \cdots, \end{aligned}$$

so that

$$64(G_{37}^{24} + G_{37}^{-24}) = e^{\pi\sqrt{37}} + 24 + 4372e^{-\pi\sqrt{37}} - \cdots = 64\{(6+\sqrt{37})^{6} + (6-\sqrt{37})^{6}\}.$$

Hence

$$e^{\pi\sqrt{37}} = 199148647.999978\ldots.$$

Similarly, from

$$g_{58} = \sqrt{\left(\frac{5+\sqrt{29}}{2}\right)},$$

we obtain

$$64(g_{58}^{24} + g_{58}^{-24}) = e^{\pi\sqrt{58}} - 24 + 4372e^{-\pi\sqrt{58}} + \cdots = 64\left\{\left(\frac{5+\sqrt{29}}{2}\right)^{12} + \left(\frac{5-\sqrt{29}}{2}\right)^{12}\right\}.$$

Hence

$$e^{\pi\sqrt{58}} = 24591257751.99999982\ldots.$$

We note that, with regard 4372, we can to obtain the following results:

27((4372)^1/2-2-1/2(((√(10-2√5) -2))/((√5-1))))+φ

Input

$$27\left(\sqrt{4372}-2-\frac{1}{2}\times\frac{\sqrt{10-2\sqrt{5}}-2}{\sqrt{5}-1}\right)+\phi$$

ϕ is the golden ratio

Result

$$\phi+27\left(-2+2\sqrt{1093}-\frac{\sqrt{10-2\sqrt{5}}-2}{2\left(\sqrt{5}-1\right)}\right)$$

Decimal approximation

1729.0526944170905625170637208637148763684189306538457854815447023...

1729.0526944….

This result is very near to the mass of candidate glueball **f_0(1710) scalar meson.** Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve. (1728 = $8^2 * 3^3$) The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number)

An Update on Brane Supersymmetry Breaking - *J. Mourad and A. Sagnotti* - arXiv:1711.11494v1 [hep-th] 30 Nov 2017

From the following vacuum equations:

$$T\, e^{\gamma_E\, \phi} \;=\; -\,\frac{\beta_E^{(p)}\, h^2}{\gamma_E}\; e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}$$

$$16\, k'\, e^{-2C} \;=\; \frac{h^2\left(p\,+\,1\,-\,\frac{2\,\beta_E^{(p)}}{\gamma_E}\right)e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}}{(7\,-\,p)}$$

$$(A')^2 \;=\; k\, e^{-2\,A} \,+\, \frac{h^2}{16(p\,+\,1)}\left(7\,-\,p\,+\,\frac{2\,\beta_E^{(p)}}{\gamma_E}\right)\, e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}$$

we have obtained, from the results almost equals of the equations, putting

$4096\, e^{-\pi\sqrt{18}}$ instead of

$$e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}$$

a new possible mathematical connection between the two exponentials. Thence, also the values concerning p, C, β_E and ϕ correspond to the exponents of e (i.e. of exp). Thence we obtain for p = 5 and β_E = 1/2:

$$e^{-6C+\phi} = 4096e^{-\pi\sqrt{18}}$$

Therefore, with respect to the exponentials of the vacuum equations, the Ramanujan's exponential has a coefficient of 4096 which is equal to 64^2, while $-6C+\phi$ is equal to $-\pi\sqrt{18}$. From this it follows that it is possible to establish mathematically, the dilaton value.

For

exp((-Pi*sqrt(18))   we obtain:

Input:

$$\exp\left(-\pi\sqrt{18}\right)$$

Exact result:

$$e^{-3\sqrt{2}\,\pi}$$

Decimal approximation:

$$1.6272016226072509292942156739117979541838581136954016\ldots \times 10^{-6}$$

$1.6272016\ldots * 10^{-6}$

Property:

$e^{-3\sqrt{2}\,\pi}$ is a transcendental number

Series representations:

$$e^{-\pi\sqrt{18}} = e^{-\pi\sqrt{17}\sum_{k=0}^{\infty} 17^{-k}\binom{1/2}{k}}$$

$$e^{-\pi\sqrt{18}} = \exp\left(-\pi\sqrt{17}\sum_{k=0}^{\infty}\frac{\left(-\frac{1}{17}\right)^k\left(-\frac{1}{2}\right)_k}{k!}\right)$$

$$e^{-\pi \sqrt{18}} = \exp\left(-\frac{\pi \sum_{j=0}^{\infty} \mathrm{Res}_{s=-\frac{1}{2}+j}\, 17^{-s}\, \Gamma\left(-\frac{1}{2}-s\right)\Gamma(s)}{2\sqrt{\pi}}\right)$$

Now, we have the following calculations:

$$e^{-6C+\phi} = 4096 e^{-\pi\sqrt{18}}$$

$$e^{-\pi\sqrt{18}} = 1.6272016\ldots * 10^{-6}$$

from which:

$$\frac{1}{4096} e^{-6C+\phi} = 1.6272016\ldots * 10^{-6}$$

$$0.000244140625\, e^{-6C+\phi} = e^{-\pi\sqrt{18}} = 1.6272016\ldots * 10^{-6}$$

Now:

$$\ln\left(e^{-\pi\sqrt{18}}\right) = -13.328648814475 = -\pi\sqrt{18}$$

And:

(1.6272016* 10^-6) *1/ (0.000244140625)

Input interpretation:

$$\frac{1.6272016}{10^6} \times \frac{1}{0.000244140625}$$

Result:

0.0066650177536

0.006665017...

Thence:

$$0.000244140625\, e^{-6C+\phi} = e^{-\pi\sqrt{18}}$$

Dividing both sides by 0.000244140625, we obtain:

$$\frac{0.000244140625}{0.000244140625} e^{-6C+\phi} = \frac{1}{0.000244140625} e^{-\pi\sqrt{18}}$$

$$e^{-6C+\phi} = 0.0066650177536$$

((((exp((-Pi*sqrt(18)))))))*1/0.000244140625

Input interpretation:

$$\exp\left(-\pi\sqrt{18}\right) \times \frac{1}{0.000244140625}$$

Result:

0.00666501785…

0.00666501785…

Series representations:

$$\frac{\exp\left(-\pi\sqrt{18}\right)}{0.000244141} = 4096\exp\left(-\pi\sqrt{17}\sum_{k=0}^{\infty}17^{-k}\binom{\frac{1}{2}}{k}\right)$$

$$\frac{\exp\left(-\pi\sqrt{18}\right)}{0.000244141} = 4096\exp\left(-\pi\sqrt{17}\sum_{k=0}^{\infty}\frac{\left(-\frac{1}{17}\right)^k\left(-\frac{1}{2}\right)_k}{k!}\right)$$

$$\frac{\exp\left(-\pi\sqrt{18}\right)}{0.000244141} = 4096\exp\left(-\frac{\pi\sum_{j=0}^{\infty}\operatorname{Res}_{s=-\frac{1}{2}+j}17^{-s}\,\Gamma\left(-\frac{1}{2}-s\right)\Gamma(s)}{2\sqrt{\pi}}\right)$$

Now:

$$e^{-6C+\phi} = 0.0066650177536$$

$$\exp\left(-\pi\sqrt{18}\right)\times\frac{1}{0.000244140625} =$$

$$e^{-\pi\sqrt{18}}\times\frac{1}{0.000244140625}$$

= 0.00666501785…

From:

ln(0.00666501784619)

Input interpretation:

$\log(0.00666501784619)$

Result:

$-5.010882647757\ldots$

-5.010882647757…

Alternative representations:

$$\log(0.006665017846190000) = \log_e(0.006665017846190000)$$

$$\log(0.006665017846190000) = \log(a)\log_a(0.006665017846190000)$$

$$\log(0.006665017846190000) = -\text{Li}_1(0.993334982153810000)$$

Series representations:

$$\log(0.006665017846190000) = -\sum_{k=1}^{\infty}\frac{(-1)^k\,(-0.993334982153810000)^k}{k}$$

$$\log(0.006665017846190000) = 2\,i\,\pi\left\lfloor\frac{\arg(0.006665017846190000 - x)}{2\,\pi}\right\rfloor + \log(x) - \sum_{k=1}^{\infty}\frac{(-1)^k\,(0.006665017846190000 - x)^k\,x^{-k}}{k} \quad \text{for } x < 0$$

$$\log(0.006665017846190000) = \left\lfloor \frac{\arg(0.006665017846190000 - z_0)}{2\pi} \right\rfloor \log\left(\frac{1}{z_0}\right) + \log(z_0) + \left\lfloor \frac{\arg(0.006665017846190000 - z_0)}{2\pi} \right\rfloor \log(z_0) - \sum_{k=1}^{\infty} \frac{(-1)^k (0.006665017846190000 - z_0)^k z_0^{-k}}{k}$$

Integral representation:

$$\log(0.006665017846190000) = \int_1^{0.006665017846190000} \frac{1}{t}\, dt$$

In conclusion:

$$-6C + \phi = -5.010882647757 \ldots$$

and for C = 1, we obtain:

$\phi = -5.010882647757 + 6 = 0.989117352243 = \boldsymbol{\phi}$

Note that the values of n_s (spectral index) 0.965, of the average of the Omega mesons Regge slope 0.987428571 and of the dilaton 0.989117352243, are also connected to the following two Rogers-Ramanujan continued fractions:

$$\frac{e^{-\frac{\pi}{5}}}{\sqrt{(\varphi-1)\sqrt{5}} - \varphi + 1} = 1 - \cfrac{e^{-\pi}}{1 + \cfrac{e^{-2\pi}}{1 + \cfrac{e^{-3\pi}}{1 + \cfrac{e^{-4\pi}}{1 + \ldots}}}} \approx 0.9568666373$$

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\frac{e^{-\pi\sqrt{5}}}{1+\frac{e^{-2\pi\sqrt{5}}}{1+\frac{e^{-3\pi\sqrt{5}}}{1+\frac{e^{-4\pi\sqrt{5}}}{1+\dots}}}}\approx 0.9991104684$$

(http://www.bitman.name/math/article/102/109/)

Also performing the 512th root of the inverse value of the Pion meson rest mass 139.57, we obtain:

((1/(139.57)))^1/512

Input interpretation:

$$\sqrt[512]{\frac{1}{139.57}}$$

Result:

0.99040073270864402755097375571330141546073279617855555551684...

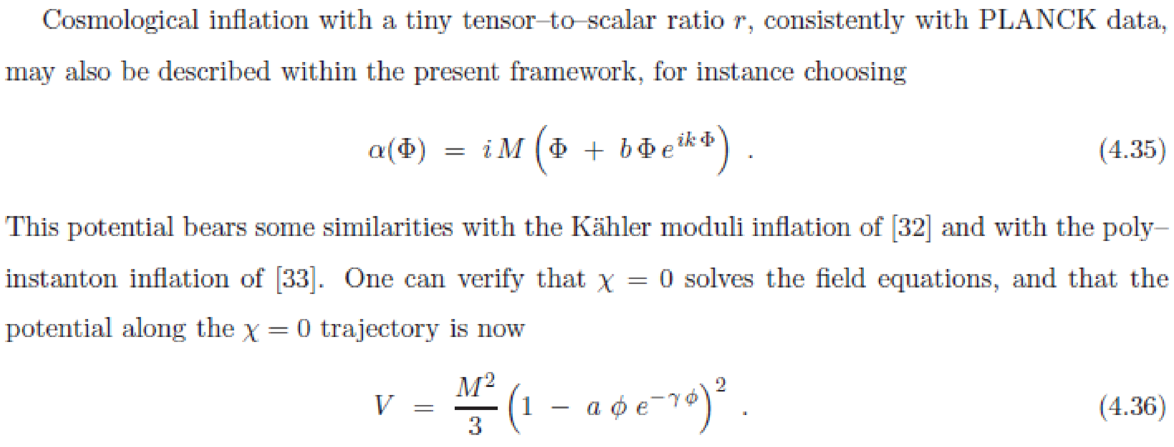
0.99040073.... result very near to the dilaton value 0.989117352243 = $\boldsymbol{\phi}$ and to the value of the following Rogers-Ramanujan continued fraction:

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\frac{e^{-\pi\sqrt{5}}}{1+\frac{e^{-2\pi\sqrt{5}}}{1+\frac{e^{-3\pi\sqrt{5}}}{1+\frac{e^{-4\pi\sqrt{5}}}{1+\dots}}}}\approx 0.9991104684$$

From

Properties of Nilpotent Supergravity - *E. Dudas, S. Ferrara, A. Kehagias and A. Sagnotti* - arXiv:1507.07842v2 [hep-th] 14 Sep 2015

We have that:



Cosmological inflation with a tiny tensor–to–scalar ratio r, consistently with PLANCK data, may also be described within the present framework, for instance choosing

$$\alpha(\Phi) \ = \ i\,M \left(\Phi \ + \ b\,\Phi\,e^{ik\,\Phi} \right) \ . \tag{4.35}$$

This potential bears some similarities with the Kähler moduli inflation of [32] and with the poly–instanton inflation of [33]. One can verify that $\chi \ = \ 0$ solves the field equations, and that the potential along the $\chi = 0$ trajectory is now

$$V \ = \ \frac{M^2}{3} \left(1 \ - \ a\,\phi\,e^{-\gamma\,\phi} \right)^2 \ . \tag{4.36}$$

We analyzing the following equation:

$$V \ = \ \frac{M^2}{3} \left(1 \ - \ a\,\phi\,e^{-\gamma\,\phi} \right)^2 \ .$$

$$\phi \ = \ \varphi \ - \ \frac{\sqrt{6}}{k} \ ,$$

$$a \ = \ \frac{b\,\gamma}{e} \ < \ 0 \ , \qquad \gamma \ = \ \frac{k}{\sqrt{6}} \ < \ 0 \ .$$

We have:

(M^2)/3*[1-(b/euler number * k/sqrt6) * (φ- sqrt6/k) * exp(-(k/sqrt6)(φ- sqrt6/k))]^2

i.e.

V = (M^2)/3*[1-(b/euler number * k/sqrt6) * (φ- sqrt6/k) * exp(-(k/sqrt6)(φ- sqrt6/k))]^2

For k = 2 and φ = 0.9991104684, that is the value of the scalar field that is equal to the value of the following Rogers-Ramanujan continued fraction:

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^{5}\sqrt[4]{5^{3}}}-1}}-\varphi+1}=1-\cfrac{e^{-\pi\sqrt{5}}}{1+\cfrac{e^{-2\pi\sqrt{5}}}{1+\cfrac{e^{-3\pi\sqrt{5}}}{1+\cfrac{e^{-4\pi\sqrt{5}}}{1+\dots}}}}\approx 0.9991104684$$

we obtain:

V = (M^2)/3*[1-(b/euler number * 2/sqrt6) * (0.9991104684- sqrt6/2) * exp(-(2/sqrt6)(0.9991104684- sqrt6/2))]^2

Input interpretation:

$$V = \frac{M^2}{3}\left(1-\left(\frac{b}{e}\times\frac{2}{\sqrt{6}}\right)\left(0.9991104684-\frac{\sqrt{6}}{2}\right)\exp\left(-\frac{2}{\sqrt{6}}\left(0.9991104684-\frac{\sqrt{6}}{2}\right)\right)\right)^2$$

Result:

$$V = \frac{1}{3}(0.0814845\,b+1)^2 M^2$$

Solutions:

$$b = \frac{225.913\left(-0.054323\, M^2 \pm 6.58545\times 10^{-10}\sqrt{M^4}\right)}{M^2} \quad (M \neq 0)$$

Alternate forms:

$$V = 0.00221324\,(b + 12.2723)^2\, M^2$$

$$V = 0.00221324\left(b^2\, M^2 + 24.5445\, b\, M^2 + 150.609\, M^2\right)$$

$$-0.00221324\, b^2\, M^2 - 0.054323\, b\, M^2 - \frac{M^2}{3} + V = 0$$

Expanded form:

$$V = 0.00221324\, b^2\, M^2 + 0.054323\, b\, M^2 + \frac{M^2}{3}$$

Alternate form assuming b, M, and V are positive:

$$V = 0.00221324\,(b + 12.2723)^2\, M^2$$

Alternate form assuming b, M, and V are real:

$$V = 0.00221324\, b^2\, M^2 + 0.054323\, b\, M^2 + 0.333333\, M^2 + 0$$

Derivative:

$$\frac{\partial}{\partial b}\left(\frac{1}{3}\,(0.0814845\, b + 1)^2\, M^2\right) = 0.054323\,(0.0814845\, b + 1)\, M^2$$

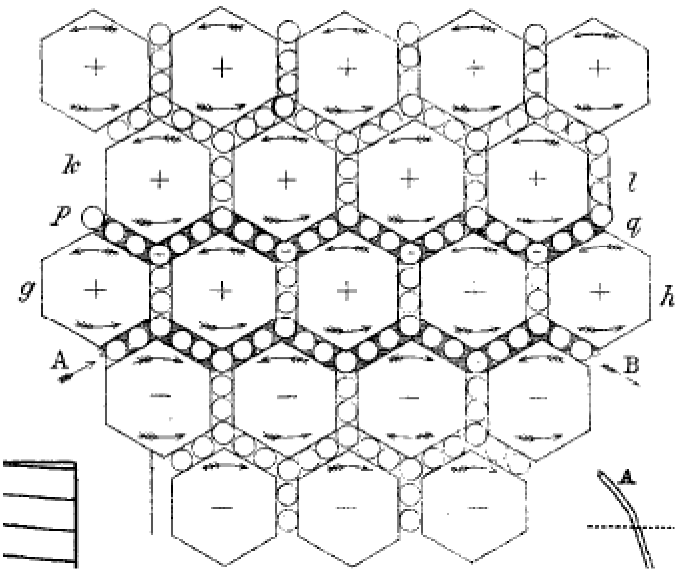
Fig: 2.



It is therefore possible to consider the vortices of the "quantum vacuum" schematized as cubes or octahedrons (the + sign inside a given vortex indicates its counterclockwise rotation, while the - sign indicates its clockwise rotation). Between vortex and vortex there is a layer of "bubbles"-universes (or universes-spheres), which flows, as in the simplified two-dimensional drawing, from A to B

Fig. 2

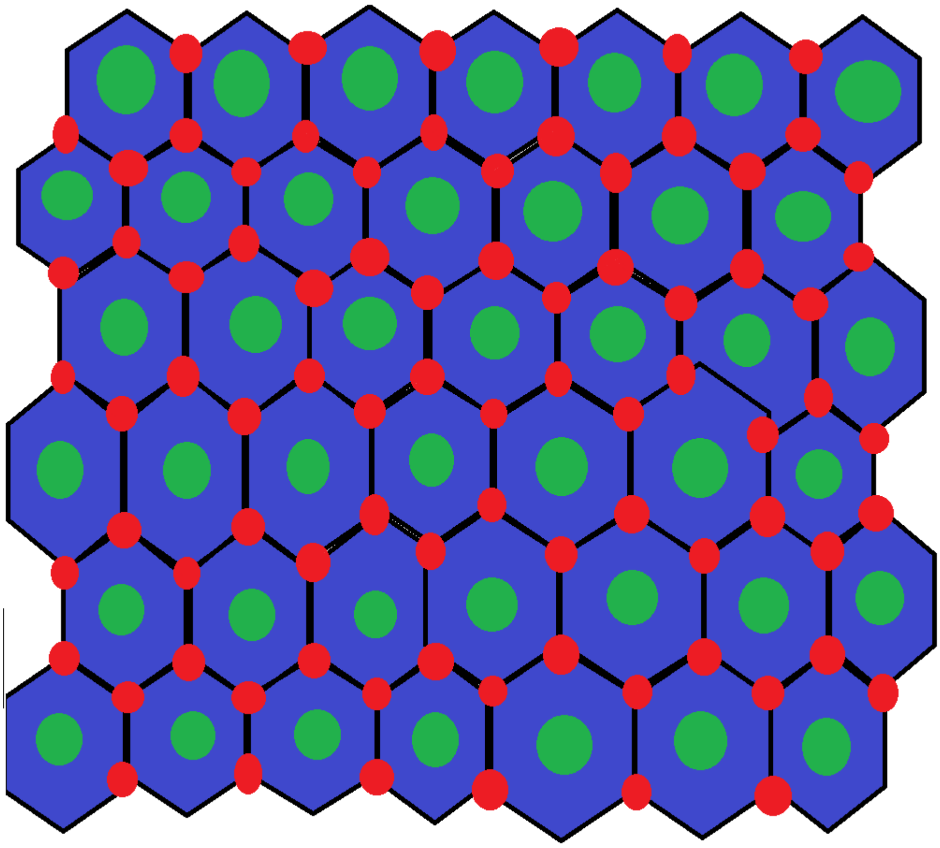


Immagine dello Spazio-Tempo a scala quantistica: le cironferenze in rosso rappresentano i punti corrispondenti alle dimensioni compattificate e gli esagoni in blu, rappresentano le "fluttuazioni" (universi potenziali – cerchi verdi) del vuoto quantistico (2D)

Proposal

Image of space-time at quantum scale: the circles in red represent the points corresponding to the compactified dimensions and the hexagons in blue, represent the "fluctuations" (potential universes - green circles) of the quantum vacuum (2D). In reality, we will have n-dimensional hyperspheres in which the compactified dimensions "roll up" and octahedrons representing the "fluctuations", containing spheres (bubbles of potential universes), of the quantum vacuum

On the analysis of various Cubic Equations that can be solved with Cardano's formula. New possible mathematical connections with the Ramanujan Recurring Numbers, DN Constant and some parameters of Number Theory and String Theory

Michele Nardelli[1], Antonio Nardelli

Abstract

In this paper, we analyze various Cubic Equations that can be solved with Cardano's formula. We obtain, new possible mathematical connections with the Ramanujan Recurring Numbers, DN Constant and some parameters of Number Theory and String Theory

Introduction

Cardano's method for cubic equations involves cube roots and introduces symmetry concepts. Similarly, string theory and M-theory involve symmetries and transformation groups that play a fundamental role in describing particles and interactions. Solutions of complete cubic equations via Cardano's method involve complex cube roots. Similarly, equations and solutions in superstring theory can often involve advanced algebraic and mathematical complexities. Solutions of cubic equations can be understood geometrically through topology and algebraic geometry. In string theory, the geometric and topological configurations of strings and branes are also central. Duality is an important concept in string theory, where different mathematical descriptions can be equivalent. Similarly, in solving cubic equations, duality links exist through cube roots.

Thus, in string theory, duality refers to the fact that different mathematical formulations or physical descriptions of a theory can be equivalent. For example, two seemingly different theories can be dual to each other, meaning they are two different ways of describing the same physical reality. This concept of duality has been very useful for understanding profound aspects of string theory and field theories.

Similarly, in solving cubic equations, duality can emerge through cube roots. The cubic equation $ax^3+bx^2+cx+d=0$ can be solved using cube roots, as in the Cardano method I described above. However, cube roots involve the concept of complex numbers, and it is sometimes possible to express the solutions in ways that highlight a duality between the solutions.

For example, if we consider complex cube roots, we can see a duality between them, since there are connections via the cube roots of unity. This duality is similar to the concept of duality in string theory, where different descriptions can be connected by similar transformations.

In both cases, duality provides a deeper way of understanding the underlying mathematical or physical structure, allowing you to explore hidden connections between different concepts.

Cubic surfaces can be associated with geometric and topological concepts. In string theory, for example, some models require spaces with particular shapes, and the geometry of the spaces can influence the properties of strings and particles. Some mathematical and physical models involving surfaces might be described by cubic or

complex equations. The geometry of surfaces and the associated mathematical structure can influence the properties of universe bubbles in the multiverse. Cubic surfaces can represent certain topological spaces, and their properties can affect the structure of the associated string theory.

The connection between the surface of a D-brane and the roots of a cubic equation can be explored in specific contexts within string theory, especially when it comes to studying the geometric and topological properties of D-branes. D-branes are extended objects on whose surface open strings can terminate. The geometry of the D-brane surface can interfere with the physics of surrounding strings. In some cases, geometry can be described mathematically through objects known in algebraic surface theory, such as cubic equations.

D-branes can host open fields, which describe particles interacting with the D-brane. Field equations on a D-brane can involve surface geometry, and in some situations, these equations can be associated with higher degree algebraic equations, such as cubic equations.

The compactification of extra dimensions, which is an important part of string theory, can be associated with the surface geometry of a D-brane. Compactification can lead to a reduction in dimensions and a geometric description that can involve algebraic equations, including cubic equations.

The topological invariants associated with the surface of a D-brane, such as the Betti number or the Chern number, can be related to geometric characteristics that can be described via algebraic equations, including cubic equations.

In some situations of duality, the description of a D-brane in a context can be dualistic to a description based on algebraic objects such as curves or surfaces, which can be represented via algebraic equations, including cubic equations.

In this paper, we will hypothesize that the solutions of the cubic equations can be used as boundary conditions to further the understanding of the formation of universe bubbles in eternal inflation. Furthermore, an octahedron could serve as a mathematical or conceptual model of the universe in the pre-Big Bang phase. Cubic equations, in this context, could represent the geometric characteristics of the quantum vacuum, while the spherical surface could be used to describe the geometry of the universe bubble.

The results $(2\sqrt{2})/\pi$, the golden ratio φ and π obtained, can be connected to the proposed cosmological model. Here's how they might be connected:

Ratio $(2\sqrt{2})/\pi$:

This relationship may have a connection with the geometric properties of the octahedron and the sphere, which have been considered as mathematical models of the early universe and universe bubbles in eternal inflation. It may reflect a fundamental relationship between the geometry of solids and the mathematical characteristics of solutions to cubic equations.

Golden Ratio φ:

The golden ratio is a mathematical constant that appears in many natural and artistic contexts and is often associated with harmonious proportions and aesthetic beauty. Its emergence in this context could suggest a kind of intrinsic symmetry or harmony in the structure of the early universe and universe bubbles.

Value of π:

The value of π is a fundamental mathematical constant that appears in many geometric formulas and relationships, including the geometry of the sphere. Its appearance could indicate a direct connection between the geometry of universe bubbles and the mathematical properties of spherical surfaces.

Ultimately, the results obtained can be interpreted as manifestations of the geometric and mathematical properties of the models proposed for the early universe and universe bubbles. This suggests that there is a profound connection between geometry, mathematics and cosmological physics, and that through the analysis of these relationships we can deepen our understanding of the universe and its fundamental phenomena.

Finally, it is also possible to hypothesize the solutions of Ramanujan's cubic equations which are related to the cubic equations solvable with the Cardano method and Padovan's recurrence relations, as boundary conditions to deepen the understanding of the formation of inflationary universe bubbles eternal and of an octahedron which could represent a mathematical or conceptual model of the primordial universe before the Big Bang. Furthermore, regarding the cubic equations, they can represent the geometric characteristics of the quantum vacuum, while the spherical surface represents the geometry of the universe bubble. The results above $(2\sqrt{2})/\pi$, the golden ratio φ and π which are obtained, can be connected to the proposed cosmological model. This hypothesis is certainly plausible.

These mathematical solutions and relationships can be seen as representations of the principles and laws that govern the formation and evolution of the universe. The cubic equations, in this context, could reflect the geometric and dynamic characteristics of the quantum vacuum, while the spherical surface could represent the geometry of the bubbles of the universe.

Regarding fundamental mathematical values, they could emerge as a consequence of the geometric and physical laws that govern the structure and evolution of the primordial universe and universe bubbles.

In conclusion, the multidisciplinary approach involving complex mathematical solutions and cosmological concepts can offer deeper insight into the fundamental nature of the universe and its processes. Exploring these connections could lead to new discoveries and insights into our understanding of the early universe and its complexity.

Cubic equations and Cardano's Formulas

We analyze the following equation:

$$x^3 + 15x = 6x^2 + 24.$$

i.e.

$$x^3 - 6x^2 + 15x - 24 = 0$$

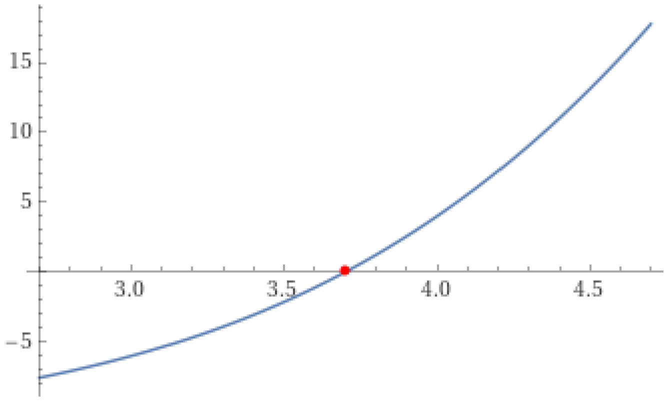
We obtain:

x^3-6x^2+15x-24 = 0

Input

$x^3 - 6x^2 + 15x - 24 = 0$

Root plot **(figure that can be related to an open string)**



Alternate forms

$$x((x-6)x+15)-24=0$$

$$x^3-6x^2+15x=24$$

$$(x-2)^3+3(x-2)-10=0$$

Real solution

$$x=2-\frac{1}{\sqrt[3]{5+\sqrt{26}}}+\sqrt[3]{5+\sqrt{26}}$$

Complex solutions

$$x=2+\frac{1}{2\sqrt[3]{5+\sqrt{26}}}-\frac{1}{2}\sqrt[3]{5+\sqrt{26}}+i\left(-\frac{\sqrt{3}}{2\sqrt[3]{5+\sqrt{26}}}-\frac{1}{2}\sqrt{3}\sqrt[3]{5+\sqrt{26}}\right)$$

$$x=2+\frac{1}{2\sqrt[3]{5+\sqrt{26}}}-\frac{1}{2}\sqrt[3]{5+\sqrt{26}}+i\left(\frac{\sqrt{3}}{2\sqrt[3]{5+\sqrt{26}}}+\frac{1}{2}\sqrt{3}\sqrt[3]{5+\sqrt{26}}\right)$$

Sum of roots

6

Product of roots

24

From

$$ax^3 + bx^2 + cx + d = 0$$

The Cardano’s Formula is:

$$x = \sqrt[3]{-\frac{b^3}{27a^3} + \frac{bc}{6a^2} - \frac{d}{2a} + \sqrt{\left(-\frac{b^3}{27a^3} + \frac{bc}{6a^2} - \frac{d}{2a}\right)^2 + \left(\frac{c}{3a} - \frac{b^2}{9a^2}\right)^3}} + \sqrt[3]{-\frac{b^3}{27a^3} + \frac{bc}{6a^2} - \frac{d}{2a} - \sqrt{\left(-\frac{b^3}{27a^3} + \frac{bc}{6a^2} - \frac{d}{2a}\right)^2 + \left(\frac{c}{3a} - \frac{b^2}{9a^2}\right)^3}} - \frac{b}{3a}$$

$$x^3 - 6x^2 + 15x - 24 = 0$$

(216/27-90/6+24/2+sqrt((216/27-90/6+24/2)^2+(15/3-36/9)^3))^1/3+(216/27-90/6+24/2-sqrt((216/27-90/6+24/2)^2+(15/3-36/9)^3))^1/3+2

Input

$$\sqrt[3]{\frac{216}{27} - \frac{90}{6} + \frac{24}{2} + \sqrt{\left(\frac{216}{27} - \frac{90}{6} + \frac{24}{2}\right)^2 + \left(\frac{15}{3} - \frac{36}{9}\right)^3}} + \sqrt[3]{\frac{216}{27} - \frac{90}{6} + \frac{24}{2} - \sqrt{\left(\frac{216}{27} - \frac{90}{6} + \frac{24}{2}\right)^2 + \left(\frac{15}{3} - \frac{36}{9}\right)^3}} + 2$$

Result

$$\sqrt[3]{5 + \sqrt{26}} + \sqrt[3]{5 - \sqrt{26}} + 2$$

All 2nd roots of 4/(3 (-2 $C_{\text{MRB}}{}^{1-1/(4\pi)+\pi}$+1+1/(2-(sqrt(26)-5)$^{1/3}$+(5+sqrt(26))$^{1/3}$)$^{1/3}$))

$$\frac{2e^0}{\sqrt{3\left(-2\,C_{\text{MRB}}{}^{1-1/(4\pi)+\pi} + 1 + \frac{1}{\sqrt[3]{2-\sqrt[3]{\sqrt{26}-5}+\sqrt[3]{5+\sqrt{26}}}}\right)}} \approx 0.9005 \quad \text{(real, principal root)}$$

$$\frac{2\,e^{i\,\pi}}{\sqrt{3\left(-2\,C_{\mathrm{MRB}}{}^{1-1/(4\,\pi)+\pi}+1+\frac{1}{\sqrt[3]{2-\sqrt[3]{\sqrt{26}-5}+\sqrt[3]{5+\sqrt{26}}}}\right)}}\approx -0.9005 \quad \text{(real root)}$$

From the following expression concerning the ratios (and/or the inverses) between the icosahedron, octahedron and tetrahedron volumes and the sphere volume.

$$\sqrt[2\pi]{\frac{\frac{5}{12}(3+\sqrt{5})d^3}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}\times\frac{1}{\frac{\frac{1}{3}\sqrt{2}a^3}{\frac{4}{3}\pi\left(\frac{a}{2}\right)^3}}\times\frac{1}{\frac{\sqrt{2}}{12}d^3\cdot\frac{1}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}}}$$

(we have highlighted the DN Constant in blue)

we obtain the following formulas concerning the icosahedron, octahedron and tetrahedron volumes together to the sphere volume.

$$\sqrt[2\pi]{\frac{5}{12}(3+\sqrt{5})d^3\times\left(\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\right)^2}$$

and

$$\sqrt[2\pi]{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\times\frac{1}{3}\sqrt{2}d^3\times\frac{\sqrt{2}}{12}d^3}$$

From

$$\sqrt[3]{5+\sqrt{26}}-\sqrt[3]{-5+\sqrt{26}}+2$$

we obtain also:

((5 + sqrt(26))^(1/3)-(-5 +sqrt(26))^(1/3)+2) ((5/12 (3+√5) d^3)×((4/3 π(d/2)^3)^2))^(1/(2Pi))

Input

$$\left(\sqrt[3]{5+\sqrt{26}}-\sqrt[3]{-5+\sqrt{26}}+2\right)\sqrt[2\pi]{\left(\frac{5}{12}\left(3+\sqrt{5}\right)d^3\right)\left(\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\right)^2}$$

Exact result

3.1415926535884…. ≈ π (Ramanujan Recurring Number)

And again:

1/6((4 (1.6180085459)^(2 π))/(5 (3 + sqrt(5))))^2

Input interpretation

$$\frac{1}{6}\left(\frac{4\times 1.6180085459^{2\pi}}{5\left(3+\sqrt{5}\right)}\right)^2$$

Result

1.6449340668468587168411795238704204763360694169882029888445046920

...

1.644934066846…. ≈ ζ(2) = $\pi^2/6$ = 1.644934 (trace of the instanton shape and Ramanujan Recurring Number)

Series representations

$$\frac{1}{6}\left(\frac{4\times 1.61800854590000^{2\pi}}{5\left(3+\sqrt{5}\right)}\right)^2=\frac{8\,e^{1.92478440155986\,\pi}}{75\left(3+\sqrt{4}\,\sum_{k=0}^{\infty}4^{-k}\binom{\frac{1}{2}}{k}\right)^2}$$

$$\frac{1}{6}\left(\frac{4\times 1.61800854590000^{2\pi}}{5\left(3+\sqrt{5}\right)}\right)^2=\frac{8\,e^{1.92478440155986\,\pi}}{75\left(3+\sqrt{4}\,\sum_{k=0}^{\infty}\frac{\left(-\frac{1}{4}\right)^k\left(-\frac{1}{2}\right)_k}{k!}\right)^2}$$

$$\frac{1}{6}\left(\frac{4\times 1.61800854590000^{2\pi}}{5\left(3+\sqrt{5}\right)}\right)^2=\frac{32\,e^{1.92478440155986\,\pi}\,\sqrt{\pi}^{\,2}}{75\left(6\sqrt{\pi}+\sum_{j=0}^{\infty}\operatorname{Res}_{s=-\frac{1}{2}+j}4^{-s}\,\Gamma\left(-\frac{1}{2}-s\right)\Gamma(s)\right)^2}$$

$\binom{n}{m}$ is the binomial coefficient

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\Gamma(x)$ is the gamma function

$\operatorname{Res}_{z=z_0} f$ is a complex residue

Now, we analyze the following equation:

$$x^3+10x=6x^2+4.$$

i.e.

$$x^3-6x^2+10x-4=0$$

The Cardano's Formula is:

$$x=\sqrt[3]{-\frac{b^3}{27a^3}+\frac{bc}{6a^2}-\frac{d}{2a}+\sqrt{\left(-\frac{b^3}{27a^3}+\frac{bc}{6a^2}-\frac{d}{2a}\right)^2+\left(\frac{c}{3a}-\frac{b^2}{9a^2}\right)^3}}$$
$$+\sqrt[3]{-\frac{b^3}{27a^3}+\frac{bc}{6a^2}-\frac{d}{2a}-\sqrt{\left(-\frac{b^3}{27a^3}+\frac{bc}{6a^2}-\frac{d}{2a}\right)^2+\left(\frac{c}{3a}-\frac{b^2}{9a^2}\right)^3}}-\frac{b}{3a}$$

Thence, for a = 1, b = -6, c = 10 and d = -4 , we obtain:

(216/27-60/6+4/2+sqrt((216/27-60/6+4/2)^2+(10/3-36/9)^3))^1/3+(216/27-60/6+4/2-sqrt((216/27-60/6+4/2)^2+(10/3-36/9)^3))^1/3+2

Input

$$\sqrt[3]{\frac{216}{27}-\frac{60}{6}+\frac{4}{2}+\sqrt{\left(\frac{216}{27}-\frac{60}{6}+\frac{4}{2}\right)^2+\left(\frac{10}{3}-\frac{36}{9}\right)^3}}+$$
$$\sqrt[3]{\frac{216}{27}-\frac{60}{6}+\frac{4}{2}-\sqrt{\left(\frac{216}{27}-\frac{60}{6}+\frac{4}{2}\right)^2+\left(\frac{10}{3}-\frac{36}{9}\right)^3}}+2$$

Result

$$2+\sqrt[6]{-1}\sqrt{\frac{2}{3}}-(-1)^{5/6}\sqrt{\frac{2}{3}}$$

Decimal approximation

Exact result

4096

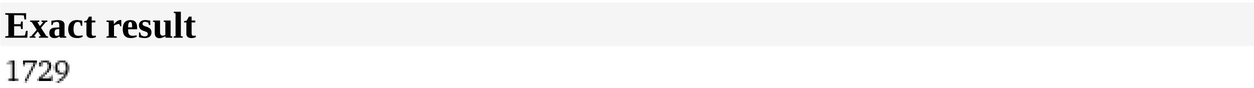
4096

The number 4096 = 64^2, is the Ramanujan Recurring Number, that when multiplied by 2 give 8192. The total amplitude vanishes for gauge group SO(8192) for bosonic string SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). This could be the implications for a pre-big bang scenario where only self-perturbative bosonic strings lived when the enthalpy was extremely low as discussed above. This regime contains all the intrinsic properties of superstrings inherent in the bosonic strings, would at the big bang give effect to the properties of matter (fermions) as Higgs Boson. This number theoretic connection to the gauge group SO(8192), gives a much more compelling relevance of the bosonic string theory SO(8192), to quantum gravity and places this string theory where it should appropriately be in the evolution of the universe from a quantum gravity perspective rather than it be neglected because it doesn't include fermionic strings to confirm to post big-bang reality. The vanishing of the bosonic string's amplitude could be explained by the effect of extreme low entropy on the quantum vacuum geometry. Thus, as the entropy increases infinitesimally as a result of the vacuum self-perturbation then also is the amplitude of the vibrating bosonic strings from zero. Thus, was right to indicate that the "vanishing of the amplitude of the bosonic string could be the results of string theory itself", but here, we give a much more elaborate explanation of what could be happening.

27*sqrt((((216/27-60/6+4/2+sqrt((216/27-60/6+4/2)^2+(10/3-36/9)^3))^1/3-(216/27-60/6+4/2+sqrt((216/27-60/6+4/2)^2+(10/3-36/9)^3))^1/3+2))^12)+1

Input

$$27\sqrt{\left(\sqrt[3]{\frac{216}{27}-\frac{60}{6}+\frac{4}{2}+\sqrt{\left(\frac{216}{27}-\frac{60}{6}+\frac{4}{2}\right)^2+\left(\frac{10}{3}-\frac{36}{9}\right)^3}}-\sqrt[3]{\frac{216}{27}-\frac{60}{6}+\frac{4}{2}+\sqrt{\left(\frac{216}{27}-\frac{60}{6}+\frac{4}{2}\right)^2+\left(\frac{10}{3}-\frac{36}{9}\right)^3}}+2\right)^{12}}+1$$



Exact result

1729

1729

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve $1728 = 8^2 \times 3^3$. The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways $10^3 + 9^3 = 12^3 + 1^3 = 1729$ and Ramanujan's recurring number). Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string. Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron. As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string. That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2. Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after?

That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

(27*sqrt((((216/27-60/6+4/2+sqrt((216/27-60/6+4/2)^2+(10/3-36/9)^3))^1/3-(216/27-60/6+4/2+sqrt((216/27-60/6+4/2)^2+(10/3-36/9)^3))^1/3+2))^12)+1)^1/15+(MRB const)^(1-1/(4π)+π)

$\operatorname{Res}_{z=z_0} f$ is a complex residue

Now, we analyze the following cubic polynomial

$z^3+3\,z^2-3\sqrt[3]{2}\;z+1$

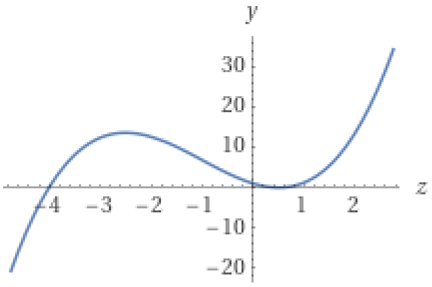
and obtain:

z^3 + 3z^2 – 3(2)^(1/3) * z + 1

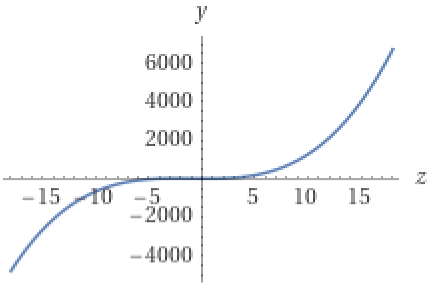
Input

$z^3+3\,z^2-3\sqrt[3]{2}\;z+1$

Plots **(figures that can be related to the open strings)**

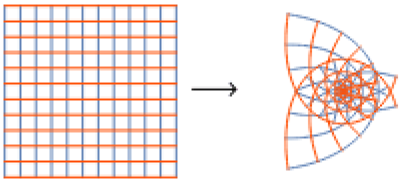


(z from −4.8 to 2.8)



(z from −18 to 18)

Complex map



Alternate forms

$$z\left(z(z+3)-3\sqrt[3]{2}\right)+1$$

$$(z+1)^3+\left(-3-3\sqrt[3]{2}\right)(z+1)+3\sqrt[3]{2}+3$$

Roots

$z \approx -4.0059$

$z \approx 0.44539$

$z \approx 0.56048$

Polynomial discriminant

$$\Delta_z = 81 - 162\sqrt[3]{2} + 81 \times 2^{2/3}$$

Branch points

(none; function is entire)

Derivative

$$\frac{d}{dz}\left(z^3 + 3z^2 - 3\sqrt[3]{2}\,z + 1\right) = 3z^2 + 6z - 3\sqrt[3]{2}$$

Indefinite integral

$$\int\left(z^3 + 3z^2 - 3\sqrt[3]{2}\,z + 1\right)dz = \frac{z^4}{4} + z^3 - \frac{3z^2}{2^{2/3}} + z + \text{constant}$$

Local maximum

$$\max\left\{z^3 + 3z^2 - 3\sqrt[3]{2}\,z + 1\right\} = \left(1 + \sqrt[3]{2}\right)\left(3 + 2\sqrt{1 + \sqrt[3]{2}}\right)$$
$$\text{at } z = -1 - \sqrt{1 + \sqrt[3]{2}}$$

Local minimum

$$\min\left\{z^3 + 3z^2 - 3\sqrt[3]{2}\,z + 1\right\} = -\left(1 + \sqrt[3]{2}\right)\left(2\sqrt{1 + \sqrt[3]{2}} - 3\right) \text{ at } z = \sqrt{1 + \sqrt[3]{2}} - 1$$

From the indefinite integral result

$$\int \left(z^3 + 3 z^2 - 3 \sqrt[3]{2}\, z + 1\right) dz = \frac{z^4}{4} + z^3 - \frac{3 z^2}{2^{2/3}} + z + \text{constant}$$

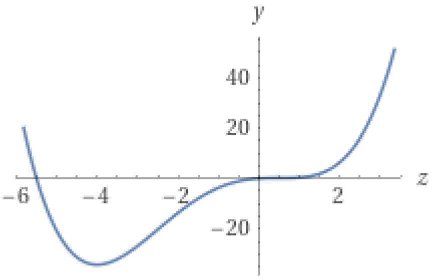
we obtain:

z - (3 z^2)/2^(2/3) + z^3 + z^4/4

Input

$$z - \frac{3 z^2}{2^{2/3}} + z^3 + \frac{z^4}{4}$$

Plots **(figures that can be related to the open strings)**



(z from −5.8 to 3.3)

$$\max\left\{\frac{z^2}{2}-\frac{z^3}{2^{2/3}}+\frac{z^4}{4}+\frac{z^5}{20}\right\}\approx 97.059 \text{ at } z\approx -5.5052$$

Local minimum

$$\min\left\{\frac{z^2}{2}-\frac{z^3}{2^{2/3}}+\frac{z^4}{4}+\frac{z^5}{20}\right\}=0 \text{ at } z=0$$

Definite integral area above the axis between the smallest and largest real roots

$$\int_{\text{root of } \{-2+\#1^3\&,10-10\#1\#2+5\#2^2+\#2^3\&\}(x) \text{ near } x=-7.00302}^{0}\left(\frac{z^2}{2}-\frac{z^3}{2^{2/3}}+\frac{z^4}{4}+\frac{z^5}{20}\right)\theta\left(\frac{z^2}{2}-\frac{z^3}{2^{2/3}}+\frac{z^4}{4}+\frac{z^5}{20}\right)dz=\boxed{\begin{aligned}&\text{root of } 161243136x^9-31946296320x^8-4139896521600x^7-\\&141754105695600x^6-287410442832000x^5-\\&1560483561150000x^4-132380791155000x^3-10790567550000x^2-\\&226796625000x-1676984375 \text{ near } x=295.243\end{aligned}}\approx 295.243$$

$\theta(x)$ is the Heaviside step function

In conclusion, from the indefinite integral result

$$\int\left(\frac{z^2}{2}-\frac{z^3}{2^{2/3}}+\frac{z^4}{4}+\frac{z^5}{20}\right)dz=\frac{z^6}{120}+\frac{z^5}{20}-\frac{z^4}{4\times 2^{2/3}}+\frac{z^3}{6}+\text{constant}$$

for V = 1/3*√2*a^3 (octahedron volume) and V = (4/3*π*r^3) (sphere volume), where r = (a/2), considering (1/3*√2*a^3) and (4/3*π*(a/2)^3) , we obtain:

((z^3/6 - z^4/(4 2^(2/3)) + z^5/20 + z^6/120)) (1/3*√2*a^3)

Input

$$\left(\frac{z^3}{6}-\frac{z^4}{4\times 2^{2/3}}+\frac{z^5}{20}+\frac{z^6}{120}\right)\left(\frac{1}{3}\sqrt{2}\,a^3\right)$$

Result

$$\frac{1}{3}\sqrt{2}\,a^3\left(\frac{z^6}{120}+\frac{z^5}{20}-\frac{z^4}{4\times 2^{2/3}}+\frac{z^3}{6}\right)$$

3D plot **(figure that can be related to a D-brane/Instanton)**

The key observation from the above plots and is that at $a = 1$, which is taken as the energy density of the universe at the Big Bang, with $z = 0$ the zero spacetime volume, the vacuum geometry brakes / or there is symmetry breaking on the vacuum quantum geometry. We see from the plots as the vacuum spacetime break/tear apart.

$$\int \frac{1}{3}\sqrt{2}\,a^3\left(\frac{z^3}{6}-\frac{z^4}{4\times 2^{2/3}}+\frac{z^5}{20}+\frac{z^6}{120}\right)dz = \frac{a^3\left(\frac{z^7}{7}+z^6-3\sqrt[3]{2}\,z^5+5\,z^4\right)}{180\sqrt{2}} + \text{constant}$$

And:

((z^3/6 - z^4/(4 2^(2/3)) + z^5/20 + z^6/120)) (4/3*π*(a/2)^3)

Input

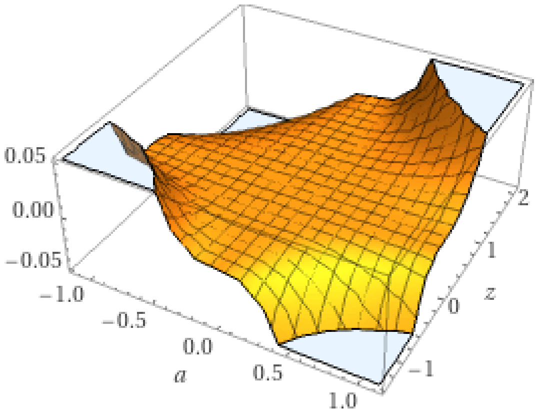
$$\left(\frac{z^3}{6}-\frac{z^4}{4\times 2^{2/3}}+\frac{z^5}{20}+\frac{z^6}{120}\right)\left(\frac{4}{3}\pi\left(\frac{a}{2}\right)^3\right)$$

Result

$$\frac{1}{6}\pi a^3\left(\frac{z^6}{120}+\frac{z^5}{20}-\frac{z^4}{4\times 2^{2/3}}+\frac{z^3}{6}\right)$$

3D plot **(figure that can be related to a D-brane/Instanton)**

The key observation from the above plots and is that at $a = 1$, which is taken as the energy density of the universe at the Big Bang, with $z = 0$ the zero spacetime volume, the vacuum geometry brakes / or there is symmetry breaking on the vacuum quantum geometry. We see from the plots as the vacuum spacetime break/tear apart.



Contour plot

$$a^3 z^3 \left(z\left(z\left(\frac{\pi z}{720}+\frac{\pi}{120}\right)-\frac{\pi}{24\times 2^{2/3}}\right)+\frac{\pi}{36}\right)$$

$$\frac{1}{720}\pi a^3 z^3 \left(z\left(z(z+6)-15\sqrt[3]{2}\right)+20\right)$$

Expanded form

$$\frac{1}{720}\pi a^3 z^6+\frac{1}{120}\pi a^3 z^5-\frac{\pi a^3 z^4}{24\times 2^{2/3}}+\frac{1}{36}\pi a^3 z^3$$

Real roots

$a = 0$

$z = 0$

$$z = -2 + \frac{-36 - 45\sqrt[3]{2}}{9\sqrt[3]{18 + 15\sqrt[3]{2} + \sqrt{5\left(2 + 60\sqrt[3]{2} - 15 \times 2^{2/3}\right)}}} - \sqrt[3]{18 + 15\sqrt[3]{2} + \sqrt{5\left(2 + 60\sqrt[3]{2} - 15 \times 2^{2/3}\right)}}$$

Complex roots

$z \approx 1.2501 - 0.8889\, i$

$z \approx 1.2501 + 0.8889\, i$

Polynomial discriminant

$\Delta = 0$

Derivative

$$\frac{\partial}{\partial z}\left(\frac{1}{3}\left(\frac{z^3}{6} - \frac{z^4}{4 \times 2^{2/3}} + \frac{z^5}{20} + \frac{z^6}{120}\right)\left(4\pi\left(\frac{a}{2}\right)^3\right)\right) = \frac{1}{120}\pi a^3 z^2 \left(z^3 + 5z^2 - 10\sqrt[3]{2}\, z + 10\right)$$

Indefinite integral

$$\int \frac{1}{6} a^3 \pi \left(\frac{z^3}{6} - \frac{z^4}{4 \times 2^{2/3}} + \frac{z^5}{20} + \frac{z^6}{120}\right) dz =$$
$$\frac{1}{720} \pi a^3 \left(\frac{z^7}{7} + z^6 - 3 \sqrt[3]{2}\; z^5 + 5 z^4\right) + \text{constant}$$

Dividing the two indefinite integral result

$$\int \frac{1}{3} \sqrt{2}\, a^3 \left(\frac{z^3}{6} - \frac{z^4}{4 \times 2^{2/3}} + \frac{z^5}{20} + \frac{z^6}{120}\right) dz =$$
$$\frac{a^3 \left(\frac{z^7}{7} + z^6 - 3 \sqrt[3]{2}\; z^5 + 5 z^4\right)}{180 \sqrt{2}} + \text{constant}$$

and

$$\int \frac{1}{6} a^3 \pi \left(\frac{z^3}{6} - \frac{z^4}{4 \times 2^{2/3}} + \frac{z^5}{20} + \frac{z^6}{120}\right) dz =$$
$$\frac{1}{720} \pi a^3 \left(\frac{z^7}{7} + z^6 - 3 \sqrt[3]{2}\; z^5 + 5 z^4\right) + \text{constant}$$

we obtain:

((a^3 (5 z^4 - 3 2^(1/3) z^5 + z^6 + z^7/7))/(180 sqrt(2)))/(1/720 a^3 π (5 z^4 - 3 2^(1/3) z^5 + z^6 + z^7/7))

Input

$$\frac{\frac{a^3 \left(5 z^4 - 3 \sqrt[3]{2}\; z^5 + z^6 + \frac{z^7}{7}\right)}{180 \sqrt{2}}}{\frac{1}{720} a^3 \pi \left(5 z^4 - 3 \sqrt[3]{2}\; z^5 + z^6 + \frac{z^7}{7}\right)}$$

Result

$$\frac{2 \sqrt{2}}{\pi}$$

Decimal approximation

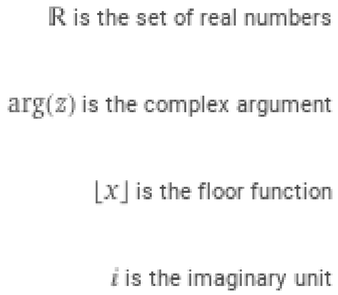
$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)



ℝ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x \rfloor$ is the floor function

i is the imaginary unit

From the following expression concerning the ratios (and/or the inverses) between the icosahedron, octahedron and tetrahedron volumes and the sphere volume.

$$\sqrt[2\pi]{\frac{\frac{5}{12}(3+\sqrt{5})d^3}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3} \times \frac{1}{\frac{\frac{1}{3}\sqrt{2}a^3}{\frac{4}{3}\pi\left(\frac{a}{2}\right)^3}} \times \frac{1}{\frac{\sqrt{2}}{12}d^3 \cdot \frac{1}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}}}$$

(we have highlighted the DN Constant in blue)

we obtain the following formulas concerning the icosahedron, octahedron and tetrahedron volumes together to the sphere volume.

$$\sqrt[2\pi]{\frac{5}{12}(3+\sqrt{5})d^3 \times \left(\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\right)^2}$$

and

$$\sqrt[2\pi]{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3 \times \frac{1}{3}\sqrt{2}d^3 \times \frac{\sqrt{2}}{12}d^3}$$

From the previous indefinite integral result

$$\int\left(\frac{z^2}{2}-\frac{z^3}{2^{2/3}}+\frac{z^4}{4}+\frac{z^5}{20}\right)dz=\frac{z^6}{120}+\frac{z^5}{20}-\frac{z^4}{4\times 2^{2/3}}+\frac{z^3}{6}+\text{constant}$$

we obtain:

((z^3/6 - z^4/(4 2^(2/3)) + z^5/20 + z^6/120)) ((5/12 (3+√5) d^3)×((4/3 π(d/2)^3)^2))^(1/(2Pi))

Input

$$\left(\frac{z^3}{6}-\frac{z^4}{4\times 2^{2/3}}+\frac{z^5}{20}+\frac{z^6}{120}\right)\sqrt[2\pi]{\left(\frac{5}{12}\left(3+\sqrt{5}\right)d^3\right)\left(\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\right)^2}$$

Exact result

$$3^{-3/(2\pi)}\sqrt[2\pi]{5\left(3+\sqrt{5}\right)}\sqrt[\pi]{\frac{\pi}{4}}\sqrt[2\pi]{d^9}\left(\frac{z^6}{120}+\frac{z^5}{20}-\frac{z^4}{4\times 2^{2/3}}+\frac{z^3}{6}\right)$$

3D plots

On the application of the formulas of the volumes of an octahedron and a sphere

With regard to a sphere inscribed in an octahedron, we have the following formulas.

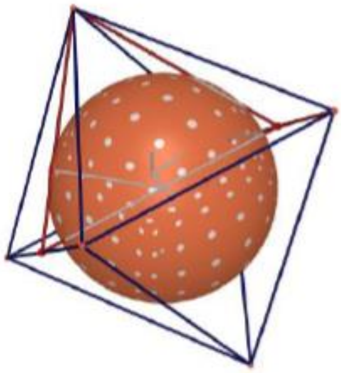

Fig: sphere inscribed in an octahedron

$V_0 = \frac{1}{3}\sqrt{2}\, l^3$

$V_s = \frac{4}{3}\pi r^3$; where $r_s = (l/2)$

With regard the ratio between the two above formulas (octahedron and sphere)

(1/3*√2*l^3)/(4/3*π*(l/2)^3)

we obtain:

Input

$$\frac{\frac{1}{3}\sqrt{2}\, l^3}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^3}$$

Result

$$\frac{\sqrt{2}\ 2}{\pi} \quad (\text{for } l \neq 0)$$

Decimal approximation

6π*√2((1/3*√2*l^3)/(4/3*π*(l/2)^3))

Input

$$6\pi\sqrt{2}\times\frac{\frac{1}{3}\sqrt{2}\,l^3}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^3}$$

Exact result

24

24

The value 24 is linked to the "Ramanujan function" (an elliptic modular function that satisfies the need for "conformal symmetry") that has 24 "modes" corresponding to the physical vibrations of a bosonic string representing a bosons. From the analysis, we observe that the is no number theoretic connection with physical vibrations of fermionic strings at extremally low entropy. This fact is confirmed by the fact that the Higgs bosons at the moment of the big bang and infinitesimally shortly thereafter, facilitated the creation of fermions (matter and antimatter particles) [8]. Thus we note that the ingredients for the formation of electromagnetic radiation from photons (a Boson), and the formation of matter from the Higgs boson after the big bang, are intrinsic properties of the vacuum energy in pre-big bang.

Series representations

$$\frac{(6\pi\sqrt{2})(\sqrt{2}\,l^3)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3}=12\sqrt{z_0}^{\,2}\left(\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(2-z_0)^k z_0^{-k}}{k!}\right)^2$$

for (not ($z_0\in\mathbb{R}$ and $-\infty<z_0\le 0$))

$$\frac{(6\pi\sqrt{2})(\sqrt{2}\,l^3)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3} = 12\exp^2\left(i\pi\left\lfloor\frac{\arg(2-x)}{2\pi}\right\rfloor\right)\sqrt{x}^2\left(\sum_{k=0}^{\infty}\frac{(-1)^k(2-x)^k x^{-k}\left(-\frac{1}{2}\right)_k}{k!}\right)^2$$

for $(x \in \mathbb{R}$ and $x < 0)$

$$\frac{(6\pi\sqrt{2})(\sqrt{2}\,l^3)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3} =$$

$$12\left(\frac{1}{z_0}\right)^{\lfloor\arg(2-z_0)/(2\pi)\rfloor} z_0^{1+\lfloor\arg(2-z_0)/(2\pi)\rfloor}\left(\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(2-z_0)^k z_0^{-k}}{k!}\right)^2$$

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x\rfloor$ is the floor function

i is the imaginary unit

This could imply that all matter (fermions) was preceded by bosons. That is, before the Big Bang, from perturbations of the vacuum energy itself, bosons were created, and successively at the Big Bang, and infinitesimally shortly after the Big Bang, fermions, were created from the vacuum energy that underwent a violent “breaking” that formed a hot plasma. of particle-antiparticle pairs. This therefore implies that quantum gravity was not necessarily “dark” to some extent, because a photon (light particle) is itself a boson. Therefore, a big bang was not necessarily the moment of the creation of light, but of the creation of matter (fermions) from vacuum energy, as this undergoes further "breaking" in the cosmological constant, in the hot plasma of matter and in the energy dark.

Indeed:

From:

https://www.academia.edu/75787512/The_Theory_of_String_A_Candidate_for_a_Generalized_Unification_Model

The Einstein's field equation and the String Theory.

The Einstein's field equation which includes the cosmological constant is:

$$R_{\mu\nu} - \frac{1}{2} g_{\mu\nu} R - \lambda g_{\mu\nu} = -8\pi \mathrm{G} \mathrm{T}_{\mu\nu} \quad (8)$$

where $R_{\mu\nu}$ is the Ricci tensor, R its trace, λ the cosmological constant, $g_{\mu\nu}$ the metric tensor of the space geometry, G the Newton's gravitational constant and $T_{\mu\nu}$ the tensor representing the properties of energy, matter and momentum.

The left hand-side of (8) represents the gravitational field and, consequently, the warped space-time, while the right hand-side represents the matter, i.e. the sources of the gravitational field.

In string theory the gravity is related to the gravitons which are bosons, whereas the matter is related to fermions. It follows that the left and right hand of (8) may be respectively related to the action of bosonic and of superstrings.

The actions of bosonic string and superstring (also containing fermions) are connected by the Palumbo-Nardelli relation (Palumbo et al. 2005):

$$-\int d^{26}x\sqrt{g}\left[-\frac{R}{16\pi G}-\frac{1}{8}g^{\mu\rho}g^{\nu\sigma}Tr\left(G_{\mu\nu}G_{\rho\sigma}\right)f(\varphi)-\frac{1}{2}g^{\mu\nu}\partial_{\mu}\varphi\partial_{\nu}\varphi\right]=$$

$$=\int_{0}^{\infty}\frac{1}{2\kappa_{10}^{2}}\int d^{10}x\sqrt{-G}e^{-2\Phi}\left[R+4\partial_{\mu}\Phi\partial^{\mu}\Phi-\frac{1}{2}|\widetilde{H}_{3}|^{2}-\frac{\kappa_{10}^{2}}{g_{10}^{2}}Tr_{\nu}\left(|F_{2}|^{2}\right)\right]$$

The sign minus in the above equation comes from the inversion of any relationship.

(2π*√2((1/3*√2*l^3)/(4/3*π*(l/2)^3)))^4

Input

$$\left(2\pi\sqrt{2}\times\frac{\frac{1}{3}\sqrt{2}\,l^{3}}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^{3}}\right)^{4}$$

Exact result

4096

$4096 = 64^2$, (Ramanujan Recurring Number) that multiplied by 2 give 8192, indeed:

The total amplitude vanishes for gauge group SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). (From: “Dilaton Tadpole for the Open Bosonic String “ Michael R. Douglas and Benjamin Grinstein - September 2,1986)

27*sqrt((2π*√2((1/3*√2*l^3)/(4/3*π*(l/2)^3)))^4)+1

Input

$$27\sqrt{\left(2\pi\sqrt{2}\times\frac{\frac{1}{3}\sqrt{2}\,l^{3}}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^{3}}\right)^{4}}+1$$

Exact result

1729

1729

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve ($1728 = 8^2 * 3^3$). The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways ($10^3 + 9^3 = 12^3 + 1^3 = 1729$) and Ramanujan's recurring number)

Series representations

$$27 \sqrt{\left(\frac{\left(2 \pi \sqrt{2}\right)\left(\sqrt{2}\, l^3\right)}{\frac{1}{3}\left(4 \pi \left(\frac{l}{2}\right)^3\right) 3}\right)^4} + 1 =$$

$$\left.\left.\left. z_0^{1/2+1/2\lfloor\arg(5-z_0)/(2\pi)\rfloor}\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(5-z_0)^k z_0^{-k}}{k!}\right)\right)\right/$$

$$\left.\left(\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(2-z_0)^k z_0^{-k}}{k!}\right)^2\right)\hat{}\left(\frac{1}{2\pi}\right)$$

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x\rfloor$ is the floor function

i is the imaginary unit

Integral representation

$$(1+z)^a = \frac{\int_{-i\infty+\gamma}^{i\infty+\gamma}\frac{\Gamma(s)\,\Gamma(-a-s)}{z^s}\,ds}{(2\pi i)\,\Gamma(-a)} \quad \text{for } (0<\gamma<-\operatorname{Re}(a) \text{ and } |\arg(z)|<\pi)$$

$\Gamma(x)$ is the gamma function

$\operatorname{Re}(z)$ is the real part of z

$|z|$ is the absolute value of z

From the above expression, we obtain the following formulas concerning the icosahedron, octahedron and tetrahedron volumes together to the sphere volume.

$$\sqrt[2\pi]{\frac{5}{12}(3+\sqrt{5})d^3 \times \left(\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\right)^2}$$

and

$$\sqrt[2\pi]{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3 \times \frac{1}{3}\sqrt{2}d^3 \times \frac{\sqrt{2}}{12}d^3}$$

Indeed, we obtain:

$$\frac{\sqrt[2\pi]{\frac{5}{12}\left(3+\sqrt{5}\right)\left(d^3\left(\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\right)^2\right)}}{\sqrt[2\pi]{\frac{4}{3}\left(\pi\left(\frac{d}{2}\right)^3 \times \frac{1}{3}\right)\sqrt{2}\left(d^3 \times \frac{\sqrt{2}}{12}\right)d^3}}$$

= 1.618008545900107…

Furthermore, from the formula

$$2^{-1/\pi}\sqrt[2\pi]{5\left(3+\sqrt{5}\right)\pi}$$

we obtain also:

(4 (1.6180085459)^(2 π))/(5 (3 + sqrt(5)))

$$\frac{4 \times 1.6180085459^{2\pi}}{5\left(3+\sqrt{5}\right)}$$

3.1415926535884871624221932509858715278931025189245576170078100613
…

3.1415926535…. = π (Ramanujan Recurring Number)

In conclusion, from the following further formula concerning the tetrahedron, the cube, the octahedron, the dodecahedron and the icosahedron volumes and their ratios (and/or the inverses) with the sphere volume, raised the expression

$$(2\log(2)log^{2/3}(3^2))/(3e^{7/3})$$

$$\left(\frac{\frac{5}{12}\left(3+\sqrt{5}\right)d^3}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}\times\frac{a^3}{\frac{4}{3}\pi\left(\frac{a}{2}\right)^3}\times\frac{1}{\frac{\frac{1}{3}\sqrt{2}\,a^3}{\frac{4}{3}\pi\left(\frac{a}{2}\right)^3}}\times\frac{1}{\frac{\sqrt{2}}{12}d^3\times\frac{1}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}}\times\frac{\frac{1}{4}\left(\left(15+7\sqrt{5}\right)d^3\right)}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}\right)^{(2\log(2)\log^{2/3}(3^2))/(3e^{7/3})}$$

i.e.

$$\left(\frac{3}{2}\right)^{(4\log(2)\log^{2/3}(9))/(3e^{7/3})}\left(\frac{5\left(3+\sqrt{5}\right)\left(15+7\sqrt{5}\right)}{\pi}\right)^{(2\log(2)\log^{2/3}(9))/(3e^{7/3})}$$

we obtain:

1.6180381711519139857456817084743134673903021614989370712917722071
…

1.6180381711…. result that is a very good approximation to the value of the golden ratio 1.618033988749… (Ramanujan Recurring Number)

Observations

We note that, from the number 8, we obtain as follows:

8^2

64

$8^2 \times 2 \times 8$

1024

$8^4 = 8^2 \times 2^6$

True

$8^4 = 4096$

$8^2 \times 2^6 = 4096$

$2^{13} = 2 \times 8^4$

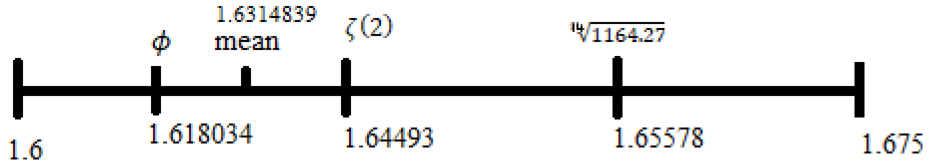
True

$2^{13} = 8192$

$2 \times 8^4 = 8192$

We notice how from the numbers 8 and 2 we get 64, 1024, 4096 and 8192, and that 8 is the fundamental number. In fact $8^2 = 64$, $8^3 = 512$, $8^4 = 4096$. We define it "fundamental number", since 8 is a Fibonacci number, which by rule, divided by the previous one, which is 5, gives 1.6 , a value that tends to the golden ratio, as for all numbers in the Fibonacci sequence

“Golden” Range

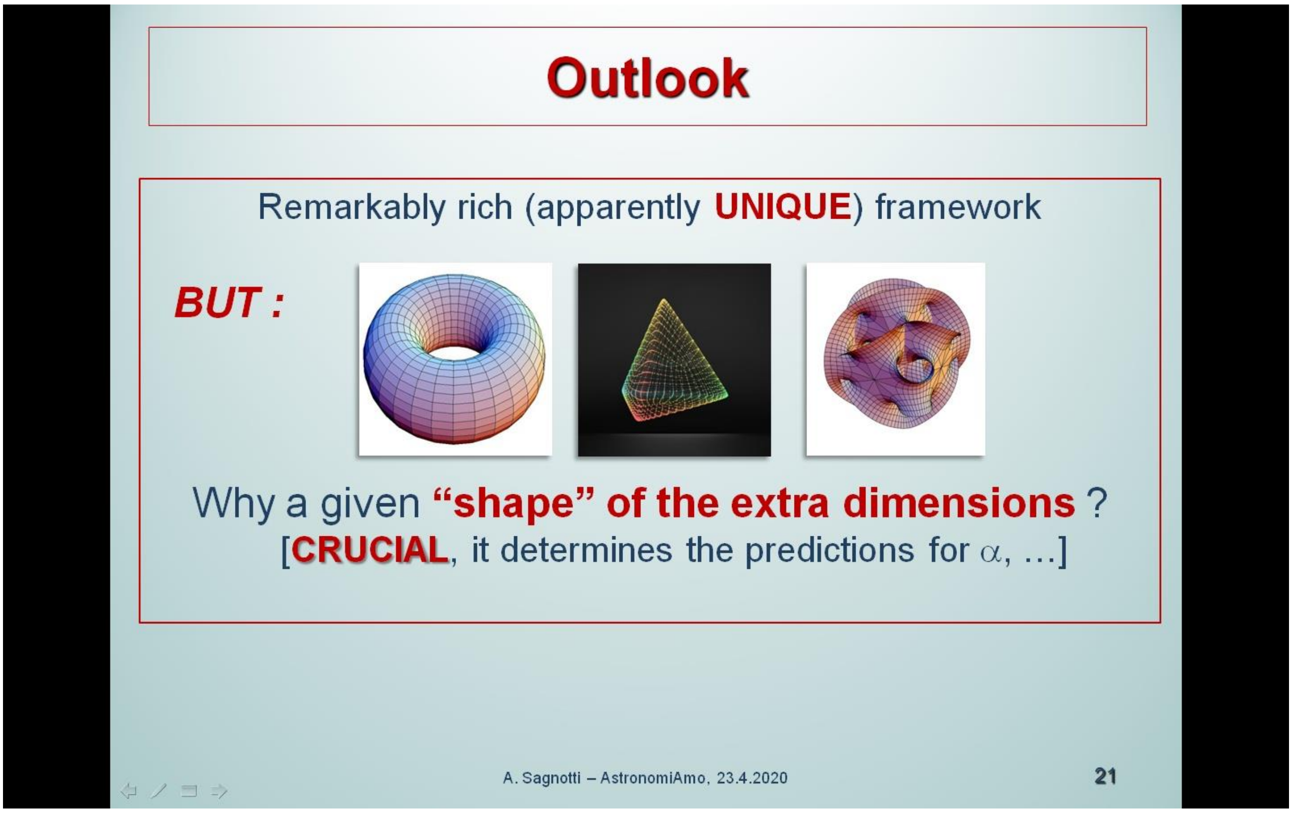


1.6314839
ϕ
mean
$\zeta(2)$
$\sqrt[14]{1164.27}$
1.6
1.618034
1.64493
1.65578
1.675

Finally we note how $8^2 = 64$, multiplied by 27, to which we add 1, is equal to 1729, the so-called "Hardy-Ramanujan number". Then taking the 15th root of 1729, we obtain a value close to $\zeta(2)$ that 1.6438 ..., which, in turn, is included in the range of what we call "golden numbers"

Furthermore for all the results very near to 1728 or 1729, adding $64 = 8^2$, one obtain values about equal to 1792 or 1793. These are values almost equal to the Planck multipole spectrum frequency 1792.35 and to the hypothetical Gluino mass

Appendix



Outlook

Remarkably rich (apparently **UNIQUE**) framework

BUT :

Why a given **“shape” of the extra dimensions** ?
[**CRUCIAL**, it determines the predictions for α, …]

A. Sagnotti – AstronomiAmo, 23.4.2020

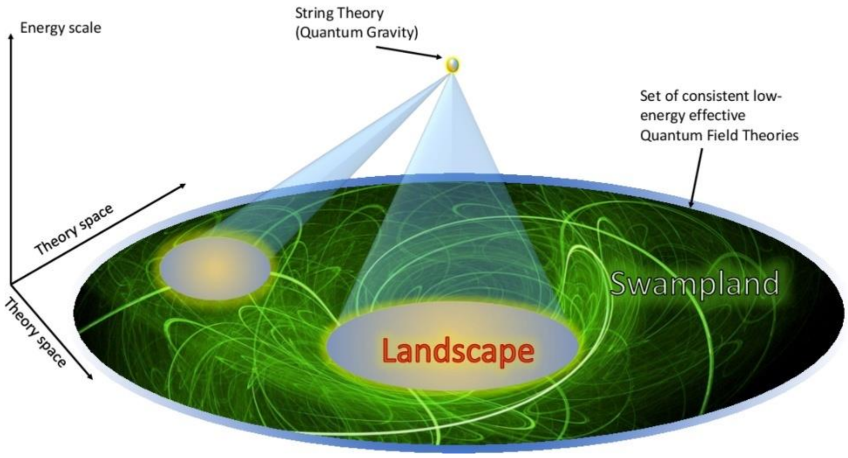
21

From: *A. Sagnotti – AstronomiAmo, 23.04.2020*

In the above figure, it is said that: “why a given shape of the extra dimensions? Crucial, it determines the predictions for α”.

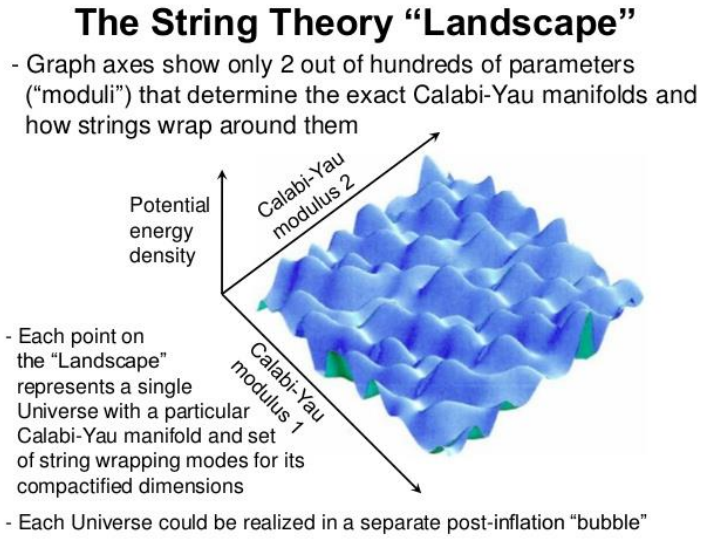
We propose that whatever shape the compactified dimensions are, their geometry must be based on the values of the golden ratio and ζ(2), (the latter connected to 1728 or 1729, whose fifteenth root provides an excellent approximation to the above mentioned value) which are recurrent as solutions of the equations that we are going to develop. It is important to specify that the initial conditions are **always** values belonging to a fundamental chapter of the work of S. Ramanujan "Modular equations and Approximations to Pi" (see references). These values are some multiples of 8 (64 and 4096), 276, which added to 4096, is equal to 4372, and finally $e^{\pi\sqrt{22}}$

We have, in certain cases, the following connections:



Energy scale
String Theory
(Quantum Gravity)
Set of consistent low-energy effective Quantum Field Theories
Theory space
Theory space
Swampland
Landscape

Fig. 1



The String Theory "Landscape"

- Graph axes show only 2 out of hundreds of parameters ("moduli") that determine the exact Calabi-Yau manifolds and how strings wrap around them

- Each point on the "Landscape" represents a single Universe with a particular Calabi-Yau manifold and set of string wrapping modes for its compactified dimensions

- Each Universe could be realized in a separate post-inflation "bubble"

Potential
energy
density
Calabi-Yau
modulus 2
Calabi-Yau
modulus 1

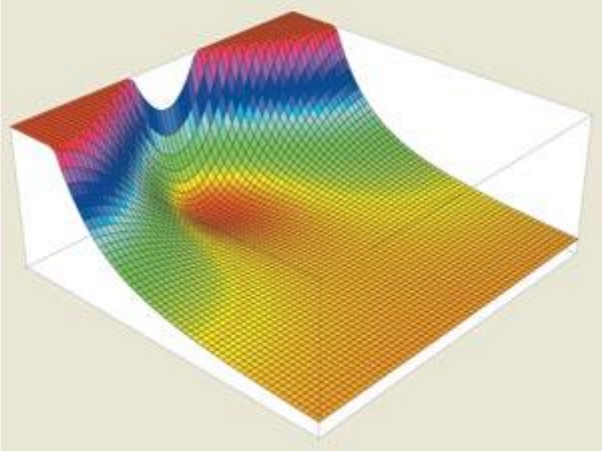

Fig. 3

Stringscape - a small part of the string-theory landscape showing the new de Sitter solution as a local minimum of the energy (vertical axis). The global minimum occurs at the infinite size of the extra dimensions on the extreme right of the figure.

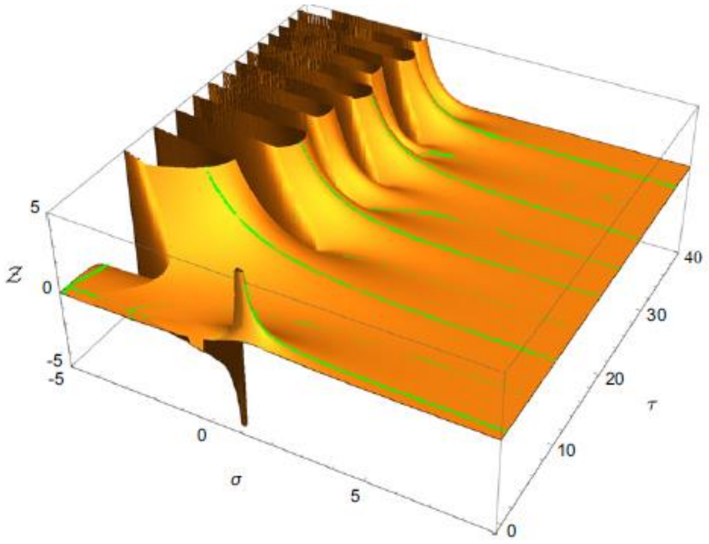

Figure 2. Lines in the complex plane where the Riemann zeta function ζ is real (green) depicted on a relief representing the positive absolute value of ζ for arguments $s \equiv \sigma + \mathrm{i}\tau$ where the real part of ζ is positive, and the negative absolute value of ζ where the real part of ζ is negative. This representation brings out most clearly that the lines of constant phase corresponding to phases of integer multiples of 2π run down the hills on the left-hand side, turn around on the right and terminate in the non-trivial zeros. This pattern repeats itself infinitely many times. The points of arrival and departure on the right-hand side of the picture are equally spaced and given by equation (11).

Fig. 4

From: https://www.mdpi.com/2227-7390/6/12/285/htm

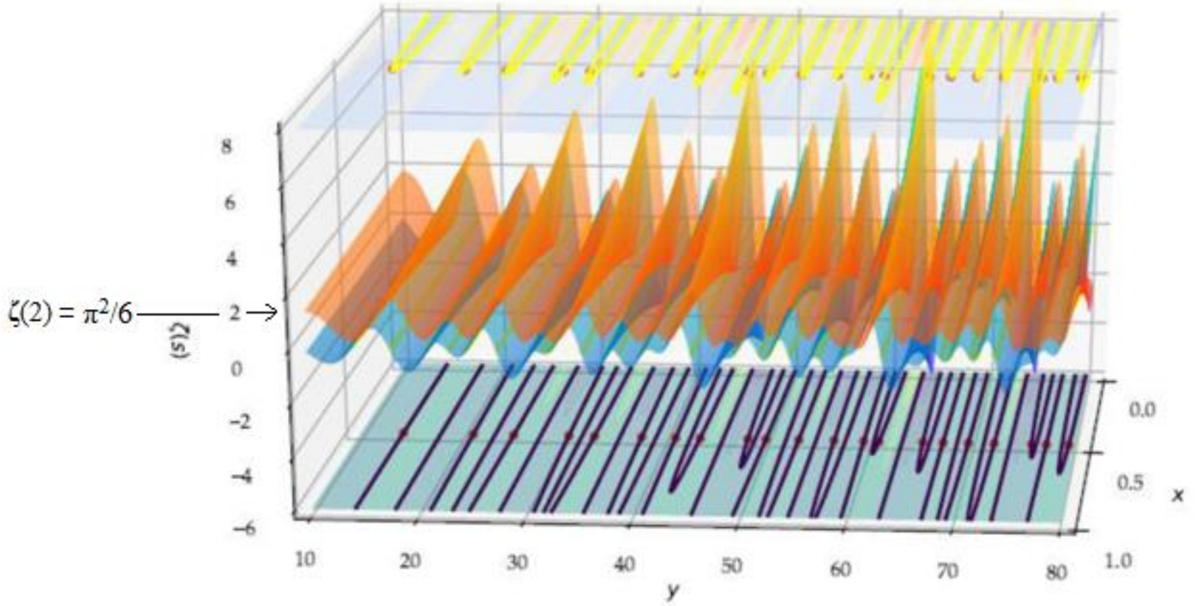

Figure 1. $C(x,y)$ and $S(x,y)$ surfaces of the Riemann $\zeta(x,y) = C - i\,S$ function, in the critical strip $\boldsymbol{s}$: $0 \leqslant x \leqslant 1; 10 \leqslant y \leqslant 80$. On the top and bottom planes, the C and S common zeros are the red points.

Fig. 5

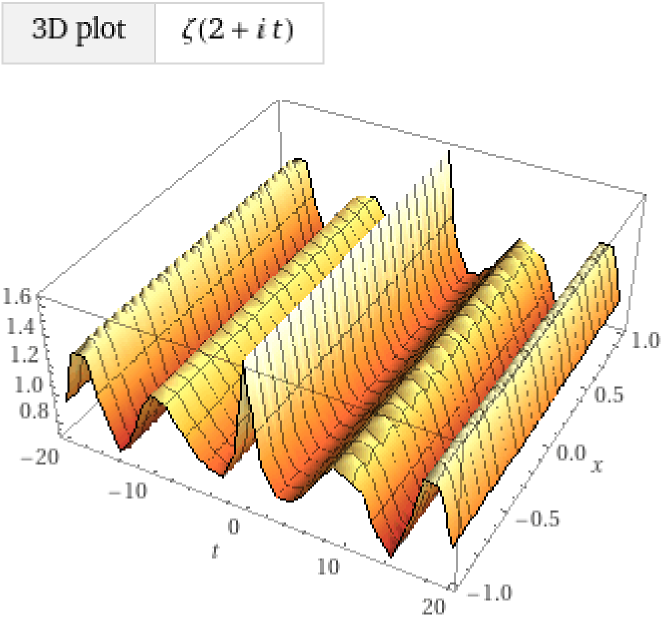

Fig. 6

Where ζ(2+it) :

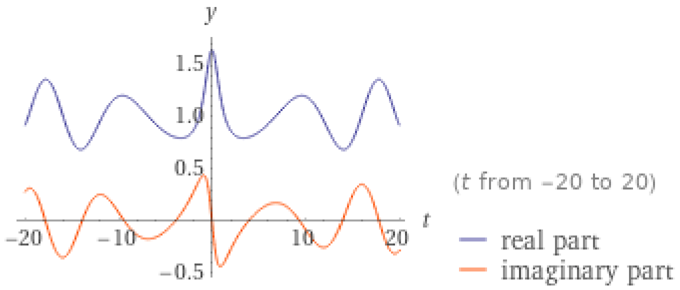
Input

$\zeta(2 + i\, t)$

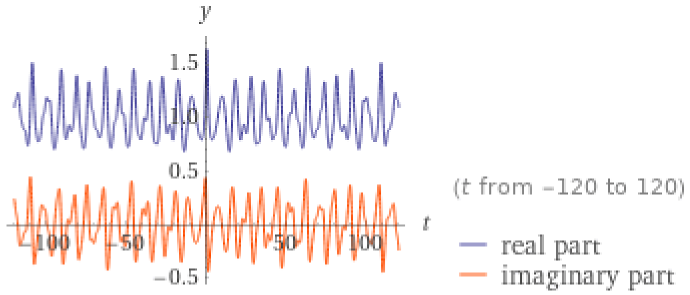
$\zeta(s)$ is the Riemann zeta function

i is the imaginary unit

Plots



(t from −20 to 20)



(t from −120 to 120)

Roots

$t = 2\, i\, (n + 1)\,, \quad n \in \mathbb{Z}\,, \quad n \geq 1$

$t = -i\, (\rho_n - 2)\,, \quad n \neq 0\,, \quad n \in \mathbb{Z}$

$\mathbb{Z}$ is the set of integers

ρ_n is the nontrivial n^{th} zero of the Riemann zeta function

Series expansion at t=0

$$\frac{\pi^2}{6} + i\,t\,\zeta'(2) - \frac{1}{2}t^2\,\zeta''(2) - \frac{1}{6}\,i\,\zeta^{(3)}(2)\,t^3 + \frac{1}{24}\,\zeta^{(4)}(2)\,t^4 + O\left(t^5\right)$$

(Taylor series)

Alternative representations

$$\zeta(2 + i\,t) = \zeta(2 + i\,t,\,1)$$

.

$$\zeta(2 + i\,t) = S_{1+i\,t,1}(1)$$

.

$$\zeta(2 + i\,t) = \frac{\zeta\left(2 + i\,t,\,\frac{1}{2}\right)}{-1 + 2^{2+i\,t}}$$

$\zeta(s,\,a)$ is the generalized Riemann zeta function

$S_{n,p}(x)$ is the Nielsen generalized polylogarithm function

Series representations

$$\zeta(2 + i\,t) = \sum_{k=1}^{\infty} k^{-2-i\,t} \quad \text{for } \operatorname{Im}(t) < 1$$

.

$$\zeta(2 + i\,t) = \frac{\sum_{k=0}^{\infty}(1 + 2\,k)^{-2-i\,t}}{1 - 2^{-2-i\,t}} \quad \text{for } \operatorname{Im}(t) < 1$$

.

$$\zeta(2 + i\,t) = e^{\sum_{k=1}^{\infty} P(k\,(2+i\,t))/k} \quad \text{for } \operatorname{Im}(t) < 1$$

$\operatorname{Im}(z)$ is the imaginary part of z

$P(z)$ gives the prime zeta function

Integral representations

$$\zeta(2+i\,t)=\frac{1}{\Gamma(2+i\,t)}\int_0^\infty\frac{\tau^{1+i\,t}}{-1+e^\tau}\,d\tau\quad\text{for }\operatorname{Im}(t)<1$$

$$\zeta(2+i\,t)=\frac{2^{1+i\,t}}{\Gamma(3+i\,t)}\int_0^\infty\tau^{2+i\,t}\operatorname{csch}^2(\tau)\,d\tau\quad\text{for }\operatorname{Im}(t)<1$$

$$\zeta(2+i\,t)=\frac{2^{1+i\,t}}{\Gamma(2+i\,t)}\int_0^\infty e^{-\tau}\,\tau^{1+i\,t}\operatorname{csch}(\tau)\,d\tau\quad\text{for }\operatorname{Im}(t)<1$$

$\Gamma(x)$ is the gamma function

$\operatorname{csch}(x)$ is the hyperbolic cosecant function

Functional equations

$$\zeta(2+i\,t)=-i\,2^{2+i\,t}\,\pi^{1+i\,t}\,\Gamma(-1-i\,t)\sinh\left(\frac{\pi\,t}{2}\right)\zeta(-1-i\,t)$$

$$\zeta(2+i\,t)=\frac{\pi^{3/2+i\,t}\,\Gamma\left(-\frac{1}{2}-\frac{i\,t}{2}\right)\zeta(-1-i\,t)}{\Gamma\left(1+\frac{i\,t}{2}\right)}$$

$$\zeta(2+i\,t)=-\frac{i\sum_{k=0}^{\infty}\frac{\Gamma\left(k-\frac{i\,t}{2}\right)\sum_{j=0}^{k}(-1)^j\,(1+2\,j)\binom{k}{j}\zeta(2+2\,j)}{k!}}{(-i+t)\,\Gamma\left(-\frac{i\,t}{2}\right)}$$

With regard the Fig. 4 the points of arrival and departure on the right-hand side of the picture are equally spaced and given by the following equation:

$$\tau'_k\equiv k\,\frac{\pi}{\ln 2},$$

with $k=\ldots,-2,-1,0,1,2,\ldots.$

we obtain:

2Pi/(ln(2))

Input:

$$2 \times \frac{\pi}{\log(2)}$$

Exact result:

$$\frac{2\pi}{\log(2)}$$

Decimal approximation:

Series representations:

$$\frac{2\pi}{\log(2)} = \frac{2\pi}{2 i \pi \left\lfloor \frac{\arg(2-x)}{2\pi} \right\rfloor + \log(x) - \sum_{k=1}^{\infty} \frac{(-1)^k (2-x)^k x^{-k}}{k}} \quad \text{for } x < 0$$

$$\frac{2\pi}{\log(2)} = \frac{2\pi}{\log(z_0) + \left\lfloor \frac{\arg(2-z_0)}{2\pi} \right\rfloor \left(\log\left(\frac{1}{z_0}\right) + \log(z_0)\right) - \sum_{k=1}^{\infty} \frac{(-1)^k (2-z_0)^k z_0^{-k}}{k}}$$

$$\frac{2\pi}{\log(2)} = \frac{2\pi}{2 i \pi \left\lfloor \frac{\pi - \arg\left(\frac{1}{z_0}\right) - \arg(z_0)}{2\pi} \right\rfloor + \log(z_0) - \sum_{k=1}^{\infty} \frac{(-1)^k (2-z_0)^k z_0^{-k}}{k}}$$

Integral representations:

$$\frac{2\pi}{\log(2)} = \frac{2\pi}{\int_1^2 \frac{1}{t}\, dt}$$

$$\frac{2\pi}{\log(2)} = \frac{4 i \pi^2}{\int_{-i \infty+\gamma}^{i \infty+\gamma} \frac{\Gamma(-s)^2 \Gamma(1+s)}{\Gamma(1-s)}\, ds} \quad \text{for } -1 < \gamma < 0$$

From which:

(2Pi/(ln(2)))*(1/12 π log(2))

Input:

$$\left(2\times\frac{\pi}{\log(2)}\right)\left(\frac{1}{12}\,\pi\log(2)\right)$$

log(x) is the natural logarithm

Exact result:

$$\frac{\pi^2}{6}$$

Decimal approximation:

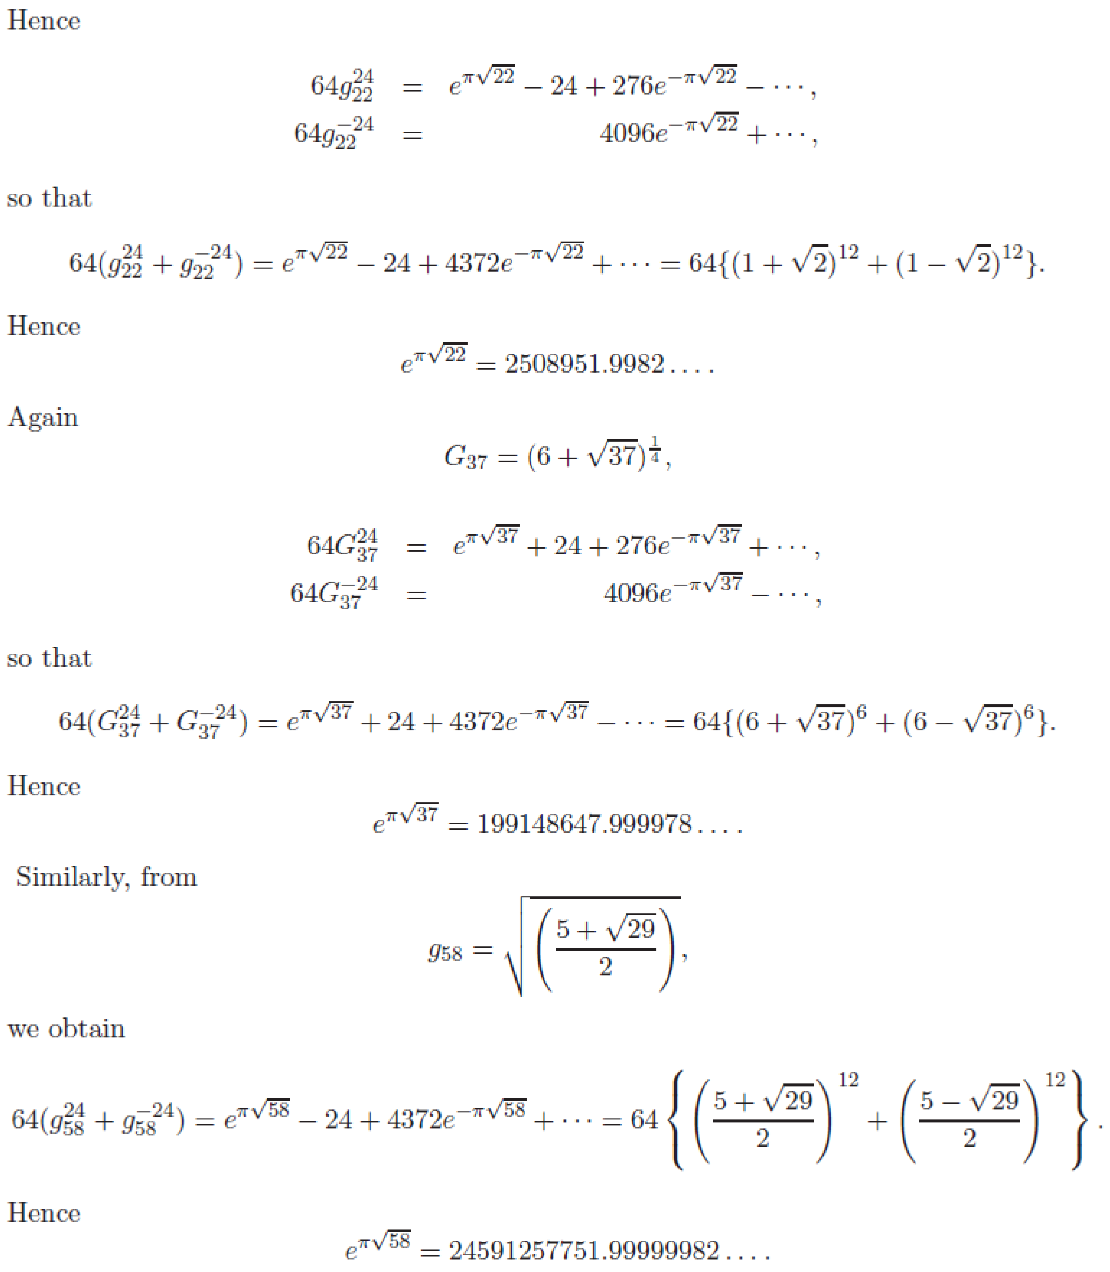
1.6449340668482264364724151666460251892189499012067984377355582293
...

1.6449340668…. = ζ(2) = $\frac{\pi^2}{6}$ = 1.644934 ...

From:

Modular equations and approximations to *π* - *Srinivasa Ramanujan* - Quarterly Journal of Mathematics, XLV, 1914, 350 – 372

We have that:



Hence

$$64g_{22}^{24} = e^{\pi\sqrt{22}} - 24 + 276e^{-\pi\sqrt{22}} - \cdots,$$
$$64g_{22}^{-24} = 4096e^{-\pi\sqrt{22}} + \cdots,$$

so that

$$64(g_{22}^{24} + g_{22}^{-24}) = e^{\pi\sqrt{22}} - 24 + 4372e^{-\pi\sqrt{22}} + \cdots = 64\{(1+\sqrt{2})^{12} + (1-\sqrt{2})^{12}\}.$$

Hence

$$e^{\pi\sqrt{22}} = 2508951.9982\ldots.$$

Again

$$G_{37} = (6+\sqrt{37})^{\frac{1}{4}},$$

$$64G_{37}^{24} = e^{\pi\sqrt{37}} + 24 + 276e^{-\pi\sqrt{37}} + \cdots,$$
$$64G_{37}^{-24} = 4096e^{-\pi\sqrt{37}} - \cdots,$$

so that

$$64(G_{37}^{24} + G_{37}^{-24}) = e^{\pi\sqrt{37}} + 24 + 4372e^{-\pi\sqrt{37}} - \cdots = 64\{(6+\sqrt{37})^{6} + (6-\sqrt{37})^{6}\}.$$

Hence

$$e^{\pi\sqrt{37}} = 199148647.999978\ldots.$$

Similarly, from

$$g_{58} = \sqrt{\left(\frac{5+\sqrt{29}}{2}\right)},$$

we obtain

$$64(g_{58}^{24} + g_{58}^{-24}) = e^{\pi\sqrt{58}} - 24 + 4372e^{-\pi\sqrt{58}} + \cdots = 64\left\{\left(\frac{5+\sqrt{29}}{2}\right)^{12} + \left(\frac{5-\sqrt{29}}{2}\right)^{12}\right\}.$$

Hence

$$e^{\pi\sqrt{58}} = 24591257751.99999982\ldots.$$

We note that, with regard 4372, we can to obtain the following results:

27((4372)^1/2-2-1/2(((√(10-2√5) -2))⁄((√5-1))))+φ

Input

$$27\left(\sqrt{4372}-2-\frac{1}{2}\times\frac{\sqrt{10-2\sqrt{5}}-2}{\sqrt{5}-1}\right)+\phi$$

ϕ is the golden ratio

Result

$$\phi+27\left(-2+2\sqrt{1093}-\frac{\sqrt{10-2\sqrt{5}}-2}{2\left(\sqrt{5}-1\right)}\right)$$

Decimal approximation

1729.0526944170905625170637208637148763684189306538457854815447023
…

1729.0526944….

This result is very near to the mass of candidate glueball **f_0(1710) scalar meson.** Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve. ($1728 = 8^2 * 3^3$) The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number)

Integral representation

$$(1+z)^{a}=\frac{\int_{-i\,\infty+\gamma}^{i\,\infty+\gamma}\frac{\Gamma(s)\,\Gamma(-a-s)}{z^{s}}\,ds}{(2\pi i)\,\Gamma(-a)}\quad\text{for } (0<\gamma<-\operatorname{Re}(a)\text{ and }|\arg(z)|<\pi)$$

From:

An Update on Brane Supersymmetry Breaking - *J. Mourad and A. Sagnotti* - arXiv:1711.11494v1 [hep-th] 30 Nov 2017

From the following vacuum equations:

$$T\,e^{\gamma_E\,\phi} \;=\; -\,\frac{\beta_E^{(p)}\,h^2}{\gamma_E}\;e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}$$

$$16\,k'\,e^{-2C} \;=\; \frac{h^2\left(p\;+\;1\;-\;\frac{2\,\beta_E^{(p)}}{\gamma_E}\right)e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}}{(7\;-\;p)}$$

$$(A')^2 \;=\; k\,e^{-2\,A}\;+\;\frac{h^2}{16(p\;+\;1)}\left(7\;-\;p\;+\;\frac{2\,\beta_E^{(p)}}{\gamma_E}\right)\;e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}$$

we have obtained, from the results almost equals of the equations, putting

$4096\,e^{-\pi\sqrt{18}}$ instead of

$$e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}$$

a new possible mathematical connection between the two exponentials. Thence, also the values concerning p, C, β_E and ϕ correspond to the exponents of e (i.e. of exp). Thence we obtain for p = 5 and $\beta_E = 1/2$:

$$e^{-6C+\phi} = 4096e^{-\pi\sqrt{18}}$$

Therefore, with respect to the exponentials of the vacuum equations, the Ramanujan's exponential has a coefficient of 4096 which is equal to 64^2, while $-6C+\phi$ is equal to $-\pi\sqrt{18}$. From this it follows that it is possible to establish mathematically, the dilaton value.

For

exp((-Pi*sqrt(18)) we obtain:

Input:

$$\exp\left(-\pi\sqrt{18}\right)$$

Exact result:

$$e^{-3\sqrt{2}\,\pi}$$

Decimal approximation:

$$1.6272016226072509292942156739117979541838581136954016\ldots\times 10^{-6}$$

$1.6272016\ldots * 10^{-6}$

Property:

$e^{-3\sqrt{2}\,\pi}$ is a transcendental number

Series representations:

$$e^{-\pi\sqrt{18}} = e^{-\pi\sqrt{17}\sum_{k=0}^{\infty}17^{-k}\binom{1/2}{k}}$$

$$e^{-\pi\sqrt{18}} = \exp\left(-\pi\sqrt{17}\sum_{k=0}^{\infty}\frac{\left(-\frac{1}{17}\right)^k\left(-\frac{1}{2}\right)_k}{k!}\right)$$

$$e^{-\pi\sqrt{18}} = \exp\left(-\frac{\pi\sum_{j=0}^{\infty}\operatorname{Res}_{s=-\frac{1}{2}+j}\,17^{-s}\,\Gamma\left(-\frac{1}{2}-s\right)\Gamma(s)}{2\sqrt{\pi}}\right)$$

Now, we have the following calculations:

$$e^{-6C+\phi} = 4096e^{-\pi\sqrt{18}}$$

$e^{-\pi\sqrt{18}}$ = 1.6272016… * 10^-6

from which:

$\frac{1}{4096}e^{-6C+\phi}$ = 1.6272016… * 10^-6

0.000244140625 $e^{-6C+\phi}$ = $e^{-\pi\sqrt{18}}$ = 1.6272016… * 10^-6

Now:

$$\ln\left(e^{-\pi\sqrt{18}}\right) = -13.328648814475 = -\pi\sqrt{18}$$

And:

(1.6272016* 10^-6) *1/ (0.000244140625)

Input interpretation:

$$\frac{1.6272016}{10^6} \times \frac{1}{0.000244140625}$$

Result:

0.0066650177536

0.006665017...

Thence:

$$0.000244140625\, e^{-6C+\phi} = e^{-\pi\sqrt{18}}$$

Dividing both sides by 0.000244140625, we obtain:

$$\frac{0.000244140625}{0.000244140625} e^{-6C+\phi} = \frac{1}{0.000244140625} e^{-\pi\sqrt{18}}$$

$$e^{-6C+\phi} = 0.0066650177536$$

((((exp((-Pi*sqrt(18)))))))*1/0.000244140625

Input interpretation:

$$\exp\left(-\pi\sqrt{18}\right) \times \frac{1}{0.000244140625}$$

Result:

0.00666501785...

0.00666501785…

Series representations:

$$\frac{\exp(-\pi\sqrt{18})}{0.000244141} = 4096 \exp\left(-\pi\sqrt{17}\sum_{k=0}^{\infty} 17^{-k}\binom{\frac{1}{2}}{k}\right)$$

$$\frac{\exp(-\pi\sqrt{18})}{0.000244141} = 4096 \exp\left(-\pi\sqrt{17}\sum_{k=0}^{\infty} \frac{\left(-\frac{1}{17}\right)^k \left(-\frac{1}{2}\right)_k}{k!}\right)$$

$$\frac{\exp(-\pi\sqrt{18})}{0.000244141} = 4096 \exp\left(-\frac{\pi \sum_{j=0}^{\infty} \operatorname{Res}_{s=-\frac{1}{2}+j} 17^{-s}\,\Gamma\left(-\frac{1}{2}-s\right)\Gamma(s)}{2\sqrt{\pi}}\right)$$

Now:

$$e^{-6C+\phi} = 0.0066650177536$$

$$\exp\left(-\pi\sqrt{18}\right)\times\frac{1}{0.000244140625} =$$

$$e^{-\pi\sqrt{18}}\times\frac{1}{0.000244140625}$$

$$= 0.00666501785\ldots$$

From:

ln(0.00666501784619)

Input interpretation:

$\log(0.00666501784619)$

Result:

$-5.010882647757\ldots$

-5.010882647757…

Alternative representations:

$$\log(0.006665017846190000) = \log_e(0.006665017846190000)$$

$$\log(0.006665017846190000) = \log(a)\log_a(0.006665017846190000)$$

$$\log(0.006665017846190000) = -\text{Li}_1(0.993334982153810000)$$

Series representations:

$$\log(0.006665017846190000) = -\sum_{k=1}^{\infty} \frac{(-1)^k (-0.993334982153810000)^k}{k}$$

$$\log(0.006665017846190000) = 2 i \pi \left\lfloor \frac{\arg(0.006665017846190000 - x)}{2 \pi} \right\rfloor + \log(x) - \sum_{k=1}^{\infty} \frac{(-1)^k (0.006665017846190000 - x)^k x^{-k}}{k} \quad \text{for } x < 0$$

$$\log(0.006665017846190000) = \left\lfloor \frac{\arg(0.006665017846190000 - z_0)}{2\pi} \right\rfloor \log\left(\frac{1}{z_0}\right) + \log(z_0) + \left\lfloor \frac{\arg(0.006665017846190000 - z_0)}{2\pi} \right\rfloor \log(z_0) - \sum_{k=1}^{\infty} \frac{(-1)^k (0.006665017846190000 - z_0)^k z_0^{-k}}{k}$$

Integral representation:

$$\log(0.006665017846190000) = \int_1^{0.006665017846190000} \frac{1}{t} \, dt$$

In conclusion:

$$-6C + \phi = -5.010882647757 \ldots$$

and for C = 1, we obtain:

$$\phi = -5.010882647757 + 6 = 0.989117352243 = \boldsymbol{\phi}$$

Note that the values of n_s (spectral index) 0.965, of the average of the Omega mesons Regge slope 0.987428571 and of the dilaton 0.989117352243, are also connected to the following two Rogers-Ramanujan continued fractions:

$$\frac{e^{-\frac{\pi}{5}}}{\sqrt{(\varphi-1)\sqrt{5}} - \varphi + 1} = 1 - \cfrac{e^{-\pi}}{1 + \cfrac{e^{-2\pi}}{1 + \cfrac{e^{-3\pi}}{1 + \cfrac{e^{-4\pi}}{1 + \ldots}}}} \approx 0.9568666373$$

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\frac{e^{-\pi\sqrt{5}}}{1+\frac{e^{-2\pi\sqrt{5}}}{1+\frac{e^{-3\pi\sqrt{5}}}{1+\frac{e^{-4\pi\sqrt{5}}}{1+\dots}}}}\approx 0.9991104684$$

(http://www.bitman.name/math/article/102/109/)

Also performing the 512th root of the inverse value of the Pion meson rest mass 139.57, we obtain:

((1/(139.57)))^1/512

Input interpretation:

$$\sqrt[512]{\frac{1}{139.57}}$$

Result:

0.990400732708644027550973755713301415460732796178555551684...

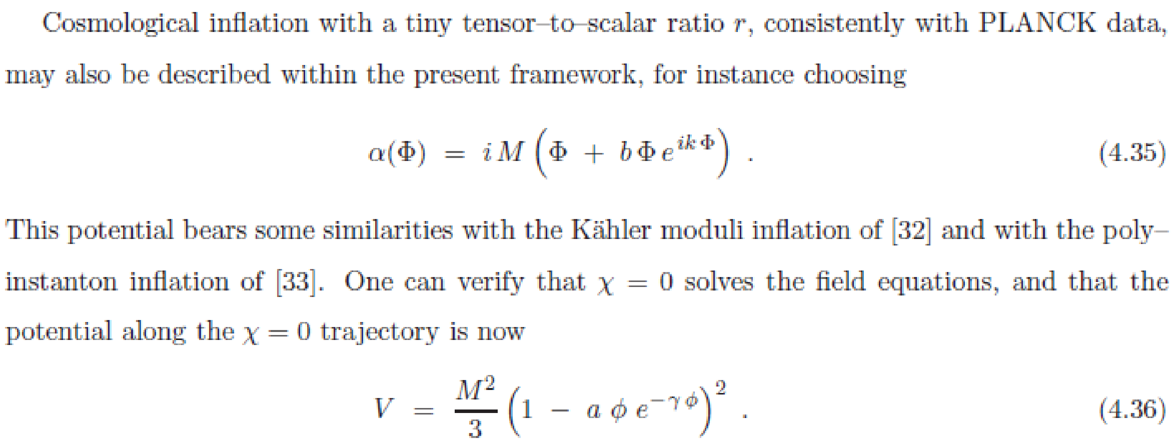
0.99040073.... result very near to the dilaton value 0.989117352243 = **ϕ** and to the value of the following Rogers-Ramanujan continued fraction:

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\frac{e^{-\pi\sqrt{5}}}{1+\frac{e^{-2\pi\sqrt{5}}}{1+\frac{e^{-3\pi\sqrt{5}}}{1+\frac{e^{-4\pi\sqrt{5}}}{1+\dots}}}}\approx 0.9991104684$$

From

Properties of Nilpotent Supergravity - *E. Dudas, S. Ferrara, A. Kehagias and A. Sagnotti* - arXiv:1507.07842v2 [hep-th] 14 Sep 2015

We have that:



Cosmological inflation with a tiny tensor–to–scalar ratio r, consistently with PLANCK data, may also be described within the present framework, for instance choosing

$$\alpha(\Phi) \;=\; i\,M\left(\Phi \;+\; b\,\Phi\,e^{ik\,\Phi}\right)\;. \tag{4.35}$$

This potential bears some similarities with the Kähler moduli inflation of [32] and with the poly–instanton inflation of [33]. One can verify that $\chi = 0$ solves the field equations, and that the potential along the $\chi = 0$ trajectory is now

$$V \;=\; \frac{M^2}{3}\left(1 \;-\; a\,\phi\,e^{-\gamma\,\phi}\right)^2\;. \tag{4.36}$$

We analyzing the following equation:

$$V \;=\; \frac{M^2}{3}\left(1 \;-\; a\,\phi\,e^{-\gamma\,\phi}\right)^2\;.$$

$$\phi \;=\; \varphi \;-\; \frac{\sqrt{6}}{k}\;,$$

$$a \;=\; \frac{b\,\gamma}{e} \;<\; 0\;, \qquad \gamma \;=\; \frac{k}{\sqrt{6}} \;<\; 0\;.$$

We have:

(M^2)/3*[1-(b/euler number * k/sqrt6) * (φ- sqrt6/k) * exp(-(k/sqrt6)(φ- sqrt6/k))]^2

i.e.

V = (M^2)/3*[1-(b/euler number * k/sqrt6) * (φ- sqrt6/k) * exp(-(k/sqrt6)(φ- sqrt6/k))]^2

For k = 2 and φ = 0.9991104684, that is the value of the scalar field that is equal to the value of the following Rogers-Ramanujan continued fraction:

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\dfrac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\frac{e^{-\pi\sqrt{5}}}{1+\dfrac{e^{-2\pi\sqrt{5}}}{1+\dfrac{e^{-3\pi\sqrt{5}}}{1+\dfrac{e^{-4\pi\sqrt{5}}}{1+\dots}}}}\approx 0.9991104684$$

we obtain:

V = (M^2)/3*[1-(b/euler number * 2/sqrt6) * (0.9991104684- sqrt6/2) * exp(-(2/sqrt6)(0.9991104684- sqrt6/2))]^2

Input interpretation:

$$V=\frac{M^2}{3}\left(1-\left(\frac{b}{e}\times\frac{2}{\sqrt{6}}\right)\left(0.9991104684-\frac{\sqrt{6}}{2}\right)\exp\left(-\frac{2}{\sqrt{6}}\left(0.9991104684-\frac{\sqrt{6}}{2}\right)\right)\right)^2$$

Result:

$$V=\frac{1}{3}\,(0.0814845\,b+1)^2\,M^2$$

Solutions:

$$b = \frac{225.913\left(-0.054323\,M^2 \pm 6.58545\times 10^{-10}\sqrt{M^4}\right)}{M^2} \quad (M \neq 0)$$

Alternate forms:

$$V = 0.00221324\,(b + 12.2723)^2\,M^2$$

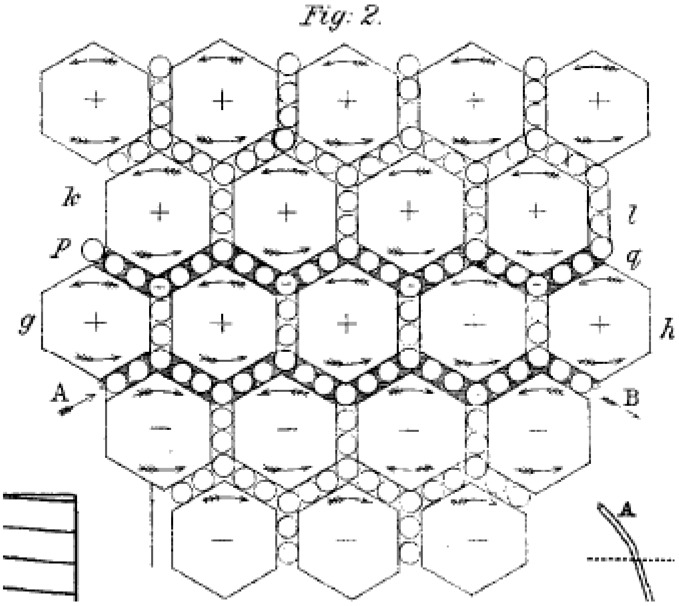
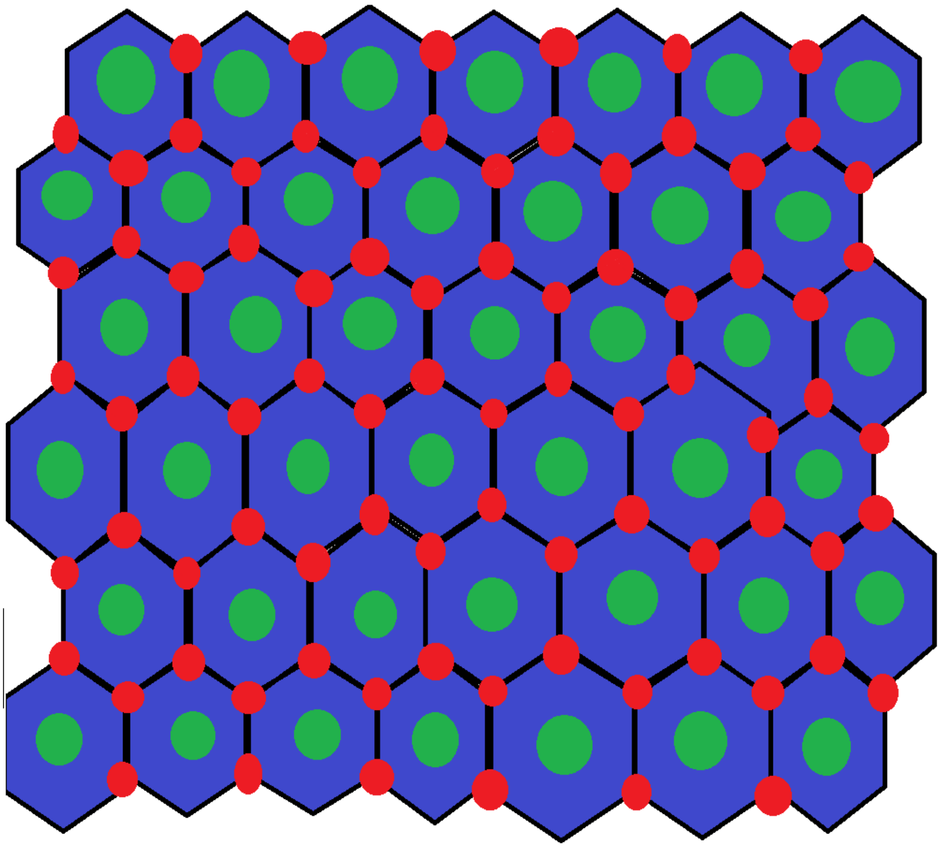
Fig. 1



It is therefore possible to consider the vortices of the "quantum vacuum" schematized as cubes or octahedrons (the + sign inside a given vortex indicates its counterclockwise rotation, while the - sign indicates its clockwise rotation). Between vortex and vortex there is a layer of "bubbles"-universes (or universes-spheres), which flows, as in the simplified two-dimensional drawing, from A to B

Fig. 2

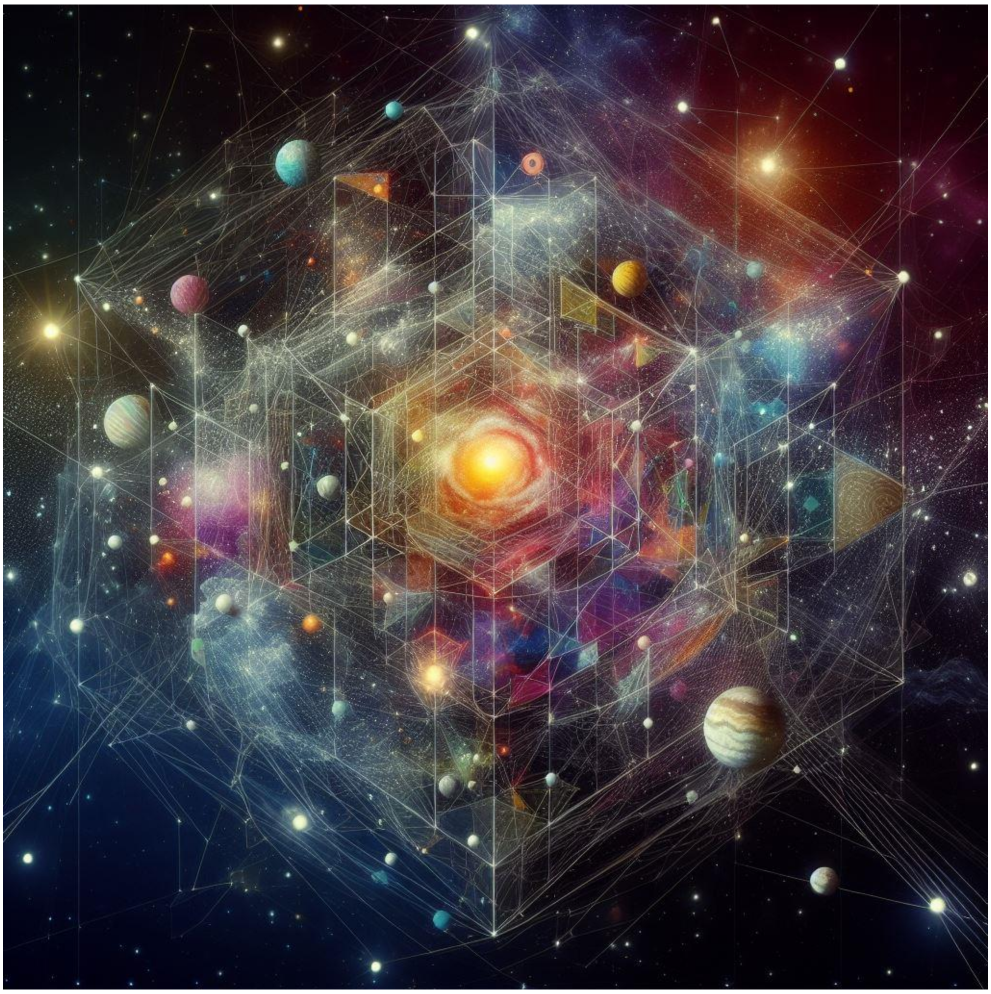
Immagine dello Spazio-Tempo a scala quantistica: le cironferenze in rosso rappresentano i punti corrispondenti alle dimensioni compattificate e gli esagoni in blu, rappresentano le "fluttuazioni" (universi potenziali – cerchi verdi) del vuoto quantistico (2D)



Proposal

Image of space-time at quantum scale: the circles in red represent the points corresponding to the compactified dimensions and the hexagons in blue, represent the "fluctuations" (potential universes - green circles) of the quantum vacuum (2D). In reality, we will have n-dimensional hyperspheres in which the compactified dimensions "roll up" and octahedrons representing the "fluctuations", containing spheres (bubbles of potential universes), of the quantum vacuum

Fig. 3



It was hypothesized that the solutions of Ramanujan's cubic equations which are related to the cubic equations solvable with Cardano's method and Padovan's recurrence relations, are boundary conditions to deepen the understanding of the formation of eternally inflationary universe bubbles and an octahedron which could represent a mathematical or conceptual model of the primordial universe before the Big Bang. Finally, regarding cubic equations, they could represent the geometric characteristics of the quantum vacuum, while the spherical surface would represent the geometry of the universe bubble. The results obtained, i.e. $(2\sqrt{2})/\pi$, the golden ratio φ and π, can be connected to the proposed cosmological model.

Acknowledgments

We would like to thank Professor **Augusto Sagnotti** theoretical physicist at Scuola Normale Superiore (Pisa – Italy) for his very useful explanations and his availability. I would like to thank also my son **Francesco Nardelli**, student of Educational Sciences, majoring in History and Philosophy, for his useful suggestions regarding the intriguing image at the end of this work

On the analysis of various Cubic Equations that can be solved with Cardano's Formula, Quartic Equations and Ramanujan’s Cubic Equations. New possible mathematical connections with the Ramanujan Recurring Numbers, DN Constant and some parameters of Number Theory and String Theory II

Michele Nardelli[1], Antonio Nardelli

Abstract

In this paper (part II), we analyze various Cubic Equations that can be solved with Cardano's formula, Quartic Equations and Ramanujan’s Cubic Equations. We obtain, new possible mathematical connections with the Ramanujan Recurring Numbers, DN Constant and some parameters of Number Theory and String Theory

Introduction

Cardano's method for cubic equations involves cube roots and introduces symmetry concepts. Similarly, string theory and M-theory involve symmetries and transformation groups that play a fundamental role in describing particles and interactions. Solutions of complete cubic equations via Cardano's method involve complex cube roots. Similarly, equations and solutions in superstring theory can often involve advanced algebraic and mathematical complexities. Solutions of cubic equations can be understood geometrically through topology and algebraic geometry. In string theory, the geometric and topological configurations of strings and branes are also central. Duality is an important concept in string theory, where different mathematical descriptions can be equivalent. Similarly, in solving cubic equations, duality links exist through cube roots.

Thus, in string theory, duality refers to the fact that different mathematical formulations or physical descriptions of a theory can be equivalent. For example, two seemingly different theories can be dual to each other, meaning they are two different ways of describing the same physical reality. This concept of duality has been very useful for understanding profound aspects of string theory and field theories.

Similarly, in solving cubic equations, duality can emerge through cube roots. The cubic equation $ax^3+bx^2+cx+d=0$ can be solved using cube roots, as in the Cardano method I described above. However, cube roots involve the concept of complex numbers, and it is sometimes possible to express the solutions in ways that highlight a duality between the solutions.

For example, if we consider complex cube roots, we can see a duality between them, since there are connections via the cube roots of unity. This duality is similar to the concept of duality in string theory, where different descriptions can be connected by similar transformations.

In both cases, duality provides a deeper way of understanding the underlying mathematical or physical structure, allowing you to explore hidden connections between different concepts.

Cubic surfaces can be associated with geometric and topological concepts. In string theory, for example, some models require spaces with particular shapes, and the geometry of the spaces can influence the properties of strings and particles. Some mathematical and physical models involving surfaces might be described by cubic or

complex equations. The geometry of surfaces and the associated mathematical structure can influence the properties of universe bubbles in the multiverse. Cubic surfaces can represent certain topological spaces, and their properties can affect the structure of the associated string theory.

The connection between the surface of a D-brane and the roots of a cubic equation can be explored in specific contexts within string theory, especially when it comes to studying the geometric and topological properties of D-branes. D-branes are extended objects on whose surface open strings can terminate. The geometry of the D-brane surface can interfere with the physics of surrounding strings. In some cases, geometry can be described mathematically through objects known in algebraic surface theory, such as cubic equations.

D-branes can host open fields, which describe particles interacting with the D-brane. Field equations on a D-brane can involve surface geometry, and in some situations, these equations can be associated with higher degree algebraic equations, such as cubic equations.

The compactification of extra dimensions, which is an important part of string theory, can be associated with the surface geometry of a D-brane. Compactification can lead to a reduction in dimensions and a geometric description that can involve algebraic equations, including cubic equations.

The topological invariants associated with the surface of a D-brane, such as the Betti number or the Chern number, can be related to geometric characteristics that can be described via algebraic equations, including cubic equations.

In some situations of duality, the description of a D-brane in a context can be dualistic to a description based on algebraic objects such as curves or surfaces, which can be represented via algebraic equations, including cubic equations.

In this paper, we will hypothesize that the solutions of the cubic equations can be used as boundary conditions to further the understanding of the formation of universe bubbles in eternal inflation. Furthermore, an octahedron could serve as a mathematical or conceptual model of the universe in the pre-Big Bang phase. Cubic equations, in this context, could represent the geometric characteristics of the quantum vacuum, while the spherical surface could be used to describe the geometry of the universe bubble.

The results (2√2)/π, the golden ratio φ and π obtained, can be connected to the proposed cosmological model. Here's how they might be connected:

Ratio (2√2)/π:

This relationship may have a connection with the geometric properties of the octahedron and the sphere, which have been considered as mathematical models of the early universe and universe bubbles in eternal inflation. It may reflect a fundamental relationship between the geometry of solids and the mathematical characteristics of solutions to cubic equations.

Golden Ratio φ:

The golden ratio is a mathematical constant that appears in many natural and artistic contexts and is often associated with harmonious proportions and aesthetic beauty. Its emergence in this context could suggest a kind of intrinsic symmetry or harmony in the structure of the early universe and universe bubbles.

Value of π:

The value of π is a fundamental mathematical constant that appears in many geometric formulas and relationships, including the geometry of the sphere. Its appearance could indicate a direct connection between the geometry of universe bubbles and the mathematical properties of spherical surfaces.

Ultimately, the results obtained can be interpreted as manifestations of the geometric and mathematical properties of the models proposed for the early universe and universe bubbles. This suggests that there is a profound connection between geometry, mathematics and cosmological physics, and that through the analysis of these relationships we can deepen our understanding of the universe and its fundamental phenomena.

Finally, it is also possible to hypothesize the solutions of Ramanujan's cubic equations which are related to the cubic equations solvable with the Cardano method and Padovan's recurrence relations, as boundary conditions to deepen the understanding of the formation of inflationary universe bubbles eternal and of an octahedron which could represent a mathematical or conceptual model of the primordial universe before the Big Bang. Furthermore, regarding the cubic equations, they can represent the geometric characteristics of the quantum vacuum, while the spherical surface represents the geometry of the universe bubble. The results above $(2\sqrt{2})/\pi$, the golden ratio φ and π which are obtained, can be connected to the proposed cosmological model. This hypothesis is certainly plausible.

These mathematical solutions and relationships can be seen as representations of the principles and laws that govern the formation and evolution of the universe. The cubic equations, in this context, could reflect the geometric and dynamic characteristics of the quantum vacuum, while the spherical surface could represent the geometry of the bubbles of the universe.

Regarding fundamental mathematical values, they could emerge as a consequence of the geometric and physical laws that govern the structure and evolution of the primordial universe and universe bubbles.

The multidisciplinary approach involving complex mathematical solutions and cosmological concepts can offer deeper insight into the fundamental nature of the universe and its processes. Exploring these connections could lead to new discoveries and insights into our understanding of the early universe and its complexity.

We will also give an example of how the result of multiplying the solutions of a quartic equation for the formula involving the ratios between the volumes of geometric solids and the Del Gaudio-Nardelli Constant approaches the values of the golden ratio and Pi, and as from the product of the solutions, the Recurring Numbers of Ramanujan are obtained. This discovery suggests that there are still many connections to be explored between mathematics and physics, and that these connections could lead to new insights into the nature of the universe and its fundamental laws.

Cubic equations and Cardano's Formulas

We analyze the following equation:

$$x^3 + 21x = 9x^2 + 5.$$

i.e.

$$x^3 - 9x^2 + 21x - 5 = 0$$

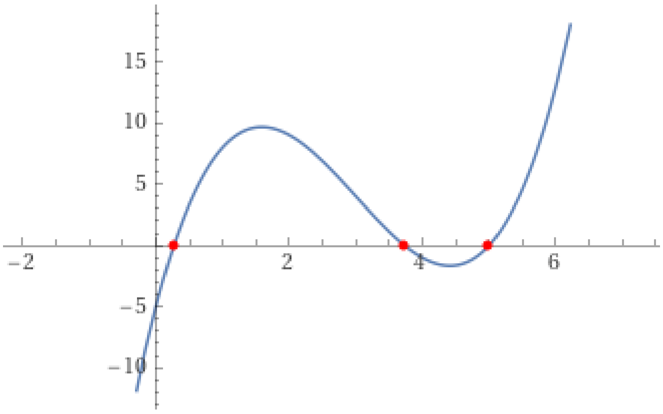
From

x^3-9x^2+21x-5=0

Input

$x^3 - 9x^2 + 21x - 5 = 0$

Root plot **(figure that can be related to an open string)**



Alternate forms

$(x-5)((x-4)x+1)=0$

$(x-5)\left(x^2-4x+1\right)=0$

$(x-3)^3-6(x-3)+4=0$

Solutions

$x=5$

$x=2-\sqrt{3}$

$x=2+\sqrt{3}$

Sum of roots

9

Product of roots

5

From

$$ax^3 + bx^2 + cx + d = 0$$

The Cardano's Formula is:

$$x = \sqrt[3]{-\frac{b^3}{27a^3} + \frac{bc}{6a^2} - \frac{d}{2a} + \sqrt{\left(-\frac{b^3}{27a^3} + \frac{bc}{6a^2} - \frac{d}{2a}\right)^2 + \left(\frac{c}{3a} - \frac{b^2}{9a^2}\right)^3}} + \sqrt[3]{-\frac{b^3}{27a^3} + \frac{bc}{6a^2} - \frac{d}{2a} - \sqrt{\left(-\frac{b^3}{27a^3} + \frac{bc}{6a^2} - \frac{d}{2a}\right)^2 + \left(\frac{c}{3a} - \frac{b^2}{9a^2}\right)^3}} - \frac{b}{3a}$$

$$x^3 - 9x^2 + 21x - 5 = 0$$

we obtain:

(-(-729)/(27)+(-189)/6+(5)/2+√(((-(-729)/(27)+(-189)/6+(5)/2)^2+(21/3-(81)/(9))^3)))^1/3+(-(-729)/(27)+(-189)/6+(5)/2-√(((-(-729)/(27)+(-189)/6+(5)/2)^2+(21/3-(81)/(9))^3)))^1/3+(9)/(3)

Input

$$\sqrt[3]{-\frac{-729}{27} - \frac{189}{6} + \frac{5}{2} + \sqrt{\left(-\frac{-729}{27} - \frac{189}{6} + \frac{5}{2}\right)^2 + \left(\frac{21}{3} - \frac{81}{9}\right)^3}} + \sqrt[3]{-\frac{-729}{27} - \frac{189}{6} + \frac{5}{2} - \sqrt{\left(-\frac{-729}{27} - \frac{189}{6} + \frac{5}{2}\right)^2 + \left(\frac{21}{3} - \frac{81}{9}\right)^3}} + \frac{9}{3}$$

Exact result

5

5

From the following expression concerning the ratios (and/or the inverses) between the icosahedron, octahedron and tetrahedron volumes and the sphere volume

$$\sqrt[2\pi]{\frac{\frac{5}{12}(3+\sqrt{5})d^3}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3} \times \frac{1}{\frac{\frac{1}{3}\sqrt{2}a^3}{\frac{4}{3}\pi\left(\frac{a}{2}\right)^3}} \times \frac{1}{\frac{\sqrt{2}}{12}d^3 \cdot \frac{1}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}}}$$

(we have highlighted the DN Constant in blue)

we obtain the following formulas concerning the icosahedron, octahedron and tetrahedron volumes together to the sphere volume.

$$\sqrt[2\pi]{\frac{5}{12}(3+\sqrt{5})d^3 \times \left(\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\right)^2}$$

and

$$\sqrt[2\pi]{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3 \times \frac{1}{3}\sqrt{2}d^3 \times \frac{\sqrt{2}}{12}d^3}$$

From the previous expression

$$\sqrt[3]{-\frac{-729}{27} - \frac{189}{6} + \frac{5}{2} + \sqrt{\left(-\frac{-729}{27} - \frac{189}{6} + \frac{5}{2}\right)^2 + \left(\frac{21}{3} - \frac{81}{9}\right)^3}} + \sqrt[3]{-\frac{-729}{27} - \frac{189}{6} + \frac{5}{2} - \sqrt{\left(-\frac{-729}{27} - \frac{189}{6} + \frac{5}{2}\right)^2 + \left(\frac{21}{3} - \frac{81}{9}\right)^3}} + \frac{9}{3}$$

we obtain:

(((27)+(-189)/6+(5)/2+√((((27)+(-189)/6+(5)/2)^2+(7-(9))^3)))^1/3+((27)+(-189)/6+(5)/2-√((((27)+(-189)/6+(5)/2)^2+(7-(9))^3)))^1/3+(3))(((5/12(3+√5) d^3)×((4/3 π(d/2)^3)^2))^(1/(2π)))

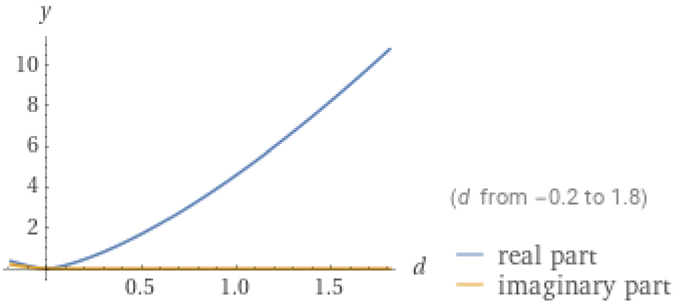
Input

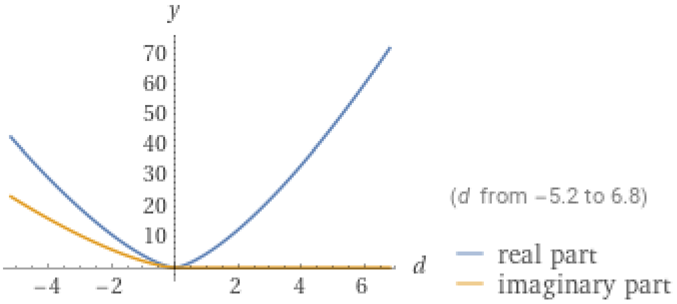
$$\left(\sqrt[3]{27-\frac{189}{6}+\frac{5}{2}+\sqrt{\left(27-\frac{189}{6}+\frac{5}{2}\right)^2+(7-9)^3}}+\sqrt[3]{27-\frac{189}{6}+\frac{5}{2}-\sqrt{\left(27-\frac{189}{6}+\frac{5}{2}\right)^2+(7-9)^3}}+3\right)\sqrt[2\pi]{\left(\frac{5}{12}\left(3+\sqrt{5}\right)d^3\right)\left(\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\right)^2}$$

Exact result

$$3^{-3/(2\pi)}\times 4^{-1/\pi}\times 5^{1+1/(2\pi)}\sqrt[2\pi]{3+\sqrt{5}}\,\sqrt[\pi]{\pi}\,\sqrt[2\pi]{d^9}$$

Plots **(figures that can be related to the open strings)**





Root

$d = 0$

Series expansion at d=∞

$$3^{-3/(2\pi)} \times 4^{-1/\pi} \times 5^{1+1/(2\pi)} \sqrt[2\pi]{3+\sqrt{5}} \sqrt[\pi]{\pi}\, d^{9/(2\pi)}$$

Derivative

$$\frac{d}{dd}\left(\left(\left(\sqrt[3]{27-\frac{189}{6}+\frac{5}{2}+\sqrt{\left(27-\frac{189}{6}+\frac{5}{2}\right)^2+(7-9)^3}} + \sqrt[3]{27-\frac{189}{6}+\frac{5}{2}-\sqrt{\left(27-\frac{189}{6}+\frac{5}{2}\right)^2+(7-9)^3}}+3\right) \sqrt[2\pi]{\frac{1}{12}\left(5\left(3+\sqrt{5}\right)d^3\right)\left(\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\right)^2}\right)\right) = \frac{2^{-(2+\pi)/\pi} \times 3^{2-3/(2\pi)} \times 5^{1+1/(2\pi)} \sqrt[2\pi]{3+\sqrt{5}} \sqrt[2\pi]{d^9}\, \pi^{1/\pi-1}}{d}$$

Indefinite integral

Quartic Equation solution

We have the following quartic equation

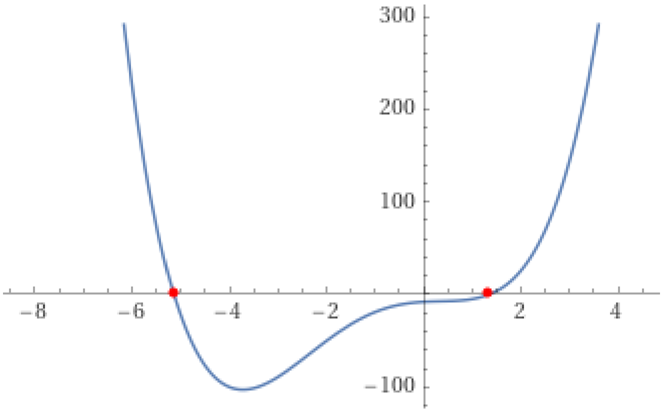
$x^4 + 4x^3 - 5x^2 + 3x - 8 = 0$

x^4 + 4x^3 - 5x^2 + 3x - 8 = 0

Input

$x^4 + 4x^3 - 5x^2 + 3x - 8 = 0$

Root plot **(figure that can be related to an open string)**



Alternate forms

$x((x-1)x(x+5)+3) - 8 = 0$

$x^4 + 4x^3 - 5x^2 + 3x = 8$

$x^4 + 4x^3 + 3x = 5x^2 + 8$

Real solutions

$$x = -1 - \frac{1}{2\sqrt{\frac{3}{22-107\sqrt[3]{\frac{2}{3\sqrt{4\,286\,109}-5803}}+\sqrt[3]{\frac{1}{2}\left(3\sqrt{4\,286\,109}-5803\right)}}}} - \frac{1}{2}\sqrt{\left(\frac{44}{3}+\frac{107}{3}\sqrt[3]{\frac{2}{3\sqrt{4\,286\,109}-5803}}-\frac{1}{3}\sqrt[3]{\frac{1}{2}\left(3\sqrt{4\,286\,109}-5803\right)}+42\sqrt{\frac{3}{22-107\sqrt[3]{\frac{2}{3\sqrt{4\,286\,109}-5803}}+\sqrt[3]{\frac{1}{2}\left(3\sqrt{4\,286\,109}-5803\right)}}}\right)}$$

$$x = -1 - \frac{1}{2\sqrt{\frac{3}{22-107\sqrt[3]{\frac{2}{3\sqrt{4\,286\,109}-5803}}+\sqrt[3]{\frac{1}{2}\left(3\sqrt{4\,286\,109}-5803\right)}}}} + \frac{1}{2}\sqrt{\left(\frac{44}{3}+\frac{107}{3}\sqrt[3]{\frac{2}{3\sqrt{4\,286\,109}-5803}}-\frac{1}{3}\sqrt[3]{\frac{1}{2}\left(3\sqrt{4\,286\,109}-5803\right)}+42\sqrt{\frac{3}{22-107\sqrt[3]{\frac{2}{3\sqrt{4\,286\,109}-5803}}+\sqrt[3]{\frac{1}{2}\left(3\sqrt{4\,286\,109}-5803\right)}}}\right)}$$

$x \approx -5.1441$

$x \approx 1.3452$

Complex solutions

$$x = -1 + \frac{1}{2\sqrt{\frac{3}{22-107\sqrt[3]{\frac{2}{3\sqrt{4286109}-5803}}+\sqrt[3]{\frac{1}{2}\left(3\sqrt{4286109}-5803\right)}}}} - \frac{1}{2}\sqrt{\left(\frac{44}{3}+\frac{107}{3}\sqrt[3]{\frac{2}{3\sqrt{4286109}-5803}}-\frac{1}{3}\sqrt[3]{\frac{1}{2}\left(3\sqrt{4286109}-5803\right)} - 42\sqrt{\frac{3}{22-107\sqrt[3]{\frac{2}{3\sqrt{4286109}-5803}}+\sqrt[3]{\frac{1}{2}\left(3\sqrt{4286109}-5803\right)}}}\right)}$$

$$x = -1 + \frac{1}{2\sqrt{\frac{3}{22-107\sqrt[3]{\frac{2}{3\sqrt{4286109}-5803}}+\sqrt[3]{\frac{1}{2}\left(3\sqrt{4286109}-5803\right)}}}} + \frac{1}{2}\sqrt{\left(\frac{44}{3}+\frac{107}{3}\sqrt[3]{\frac{2}{3\sqrt{4286109}-5803}}-\frac{1}{3}\sqrt[3]{\frac{1}{2}\left(3\sqrt{4286109}-5803\right)} - 42\sqrt{\frac{3}{22-107\sqrt[3]{\frac{2}{3\sqrt{4286109}-5803}}+\sqrt[3]{\frac{1}{2}\left(3\sqrt{4286109}-5803\right)}}}\right)}$$

Sum of roots

-4

Product of roots

-8

From the real solution

$$x = -1 - \frac{1}{2\sqrt{\frac{3}{22-107\sqrt[3]{\frac{2}{3\sqrt{4286109}-5803}}+\sqrt[3]{\frac{1}{2}\left(3\sqrt{4286109}-5803\right)}}}} - \frac{1}{2}\sqrt{\left(\frac{44}{3}+\frac{107}{3}\sqrt[3]{\frac{2}{3\sqrt{4286109}-5803}}-\frac{1}{3}\sqrt[3]{\frac{1}{2}\left(3\sqrt{4286109}-5803\right)}+ 42\sqrt{\frac{3}{22-107\sqrt[3]{\frac{2}{3\sqrt{4286109}-5803}}+\sqrt[3]{\frac{1}{2}\left(3\sqrt{4286109}-5803\right)}}}\right)}$$

That is:

(1/2 (3 sqrt(4286109) - 5803))^(1/3)

Input

$$\sqrt[3]{\frac{1}{2}\left(3\sqrt{4286109}-5803\right)}$$

1.075201195541

We have the following expression concerning the ratios (and/or the inverses) between the icosahedron, octahedron and tetrahedron volumes and the sphere volume.

$$\sqrt[2\pi]{\frac{\frac{5}{12}(3+\sqrt{5})d^3}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3} \times \frac{1}{\frac{\frac{1}{3}\sqrt{2}a^3}{\frac{4}{3}\pi\left(\frac{a}{2}\right)^3}} \times \frac{1}{\frac{\sqrt{2}}{12}d^3 \cdot \frac{1}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}}}$$

(we have highlighted the DN Constant in blue)

From the above expression, we obtain the following formulas concerning the icosahedron, octahedron and tetrahedron volumes together to the sphere volume.

$$\sqrt[2\pi]{\frac{5}{12}(3+\sqrt{5})d^3 \times \left(\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\right)^2}$$

and

$$\sqrt[2\pi]{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3 \times \frac{1}{3}\sqrt{2}d^3 \times \frac{\sqrt{2}}{12}d^3}$$

From the above formula, concerning a real root

$$-1-\frac{1}{2\sqrt{\frac{3}{22+107\times(-0.1698897872287)+5.8861690058728}}}-$$
$$\frac{1}{2}\sqrt{\left(\frac{44}{3}+\frac{107}{3}\sqrt[3]{\frac{2}{3\sqrt{4286109}-5803}}-\frac{1}{3}\sqrt[3]{\frac{1}{2}\left(3\sqrt{4286109}-5803\right)}+\right.}$$
$$\left.42\sqrt{\frac{3}{22+107\times(-0.1698897872287)+5.8861690058728}}\right)$$

we obtain:

((-1-1/(2√(3/(22-107 0.1698+5.886))-1/2√(44/3+107/3(2/(3√(4286109) - 5803))^(1/3)-1/3 (1/2(3√(4286109)-5803))^(1/3)+42√(3/(22-107 0.1698+5.886)))))((((5/12(3+√5)d^3)((4/3π(d/2)^3)^2))^(1/(2Pi))))

Input

$$\left(-1-\frac{1}{2\sqrt{\frac{3}{22-107\times0.1698+5.886}}}-\frac{1}{2}\sqrt{\left(\frac{44}{3}+\frac{107}{3}\sqrt[3]{\frac{2}{3\sqrt{4286109}-5803}}-\frac{1}{3}\sqrt[3]{\frac{1}{2}\left(3\sqrt{4286109}-5803\right)}+42\sqrt{\frac{3}{22-107\times0.1698+5.886}}\right)}\right)\sqrt[2\pi]{\left(\frac{5}{12}\left(3+\sqrt{5}\right)d^3\right)\left(\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\right)^2}$$

Result

Result

23.9999999999748825760729706627211641894087296576896

23.999999… ≈ 24

The value 24 is linked to the "Ramanujan function" (an elliptic modular function that satisfies the need for "conformal symmetry") that has 24 "modes" corresponding to the physical vibrations of a bosonic string representing a bosons. From the analysis, we observe that the is no number theoretic connection with physical vibrations of fermionic strings at extremally low entropy. This fact is confirmed by the fact that the Higgs bosons at the moment of the big bang and infinitesimally shortly thereafter, facilitated the creation of fermions (matter and antimatter particles). Thus we note that the ingredients for the formation of electromagnetic radiation from photons (a Boson), and the formation of matter from the Higgs boson after the big bang, are intrinsic properties of the vacuum energy in pre-big bang.

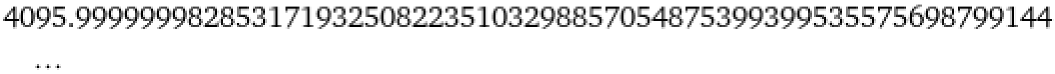
Result



4095.9999999828531719325082235103298857054875399399535575698799144

…

4095.999999… ≈ 4096

The number 4096 = 64^2, is the Ramanujan Recurring Number, that when multiplied by 2 give 8192. The total amplitude vanishes for gauge group SO(8192) for bosonic string SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). This could be the implications for a pre-big bang scenario where only self-perturbative bosonic strings lived when the enthalpy was extremely low as discussed above. This regime contains all the intrinsic properties of superstrings inherent in the bosonic strings, would at the big bang give effect to the properties of matter (fermions) as Higgs Boson. This number theoretic connection to the gauge group SO(8192), gives a much more compelling relevance of the bosonic string theory SO(8192), to quantum gravity and places this string theory where it should appropriately be in the evolution of the universe from a quantum gravity perspective rather than it be neglected because it doesn't include fermionic strings to confirm to post big-bang reality. The vanishing of the bosonic string's amplitude could be explained by the effect of extreme low entropy on the quantum vacuum geometry. Thus, as the entropy increases infinitesimally as a result of the vacuum self-perturbation then also is the amplitude of the vibrating bosonic strings from zero. Thus, was right to indicate that the "vanishing of the amplitude of the bosonic string could be the results of string theory itself", but here, we give a much more elaborate explanation of what could be happening.

27*sqrt((-5.14412309824*1.345238094282*(-0.1005574980207-1.070488580268i)*(-0.1005574980207+1.070488580268i))^4)+1

Result

1728.9999999963830909545096680868018335924222740118423254707499364

…

1728.999999… ≈ 1729

This result is very near to the mass of candidate glueball $f_0(1710)$ scalar meson. Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve $1728 = 8^2 \times 3^3$. The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number, as it can be expressed as the sum of two cubes in two different ways $10^3 + 9^3 = 12^3 + 1^3 = 1729$ and Ramanujan's recurring number). Since bosons are made of gauge bosons and scalar bosons (meson), then this number theoretic analysis perhaps confirms that the number 1729, confirm the fact that both the gauge and scalar bosons are actually different states of a single bosonic string, and that these states are isomorphic or that the states vibrations are synchronised with the state of the bosonic string. This also imply that each state lives inside a cubic or octahedron as a spherical cloud, and that the total sum of these two states is the state of the bosonic string. Taking the cross section of the bosonic string, we realise that it must be a rectangular, or a two shaped octahedron. As the string vibrates in difference frequencies, so is the two spherical cloud states inside the string. That is, the string vibrations simply excites the gauge bosons i.e Photon, gluon, W and Z inside one cube/octahedron, and the scalar boson i.e. Higgs inside the other cube/octahedron.

Furthermore, if we bring the picture of loop quantum gravity (LQG) with the property of a discontinues quantum geometry, we can therefore, think of the graviton living on the vertices of the rectangles or the octahedrons. This graviton then acts a glue binding the bosonic strings lattice together forming a complete cross section of alternating states of between the gauge bosons and scalar bosons. This arrangement of states then gives a precise supersymmetric quantum picture of the vacuum geometry at low entropy.

But the geometry further reveals very important fact, that since the vacuum geometry is discontinues, then we observe that there is no relation whatsoever between the quantum vibrational frequencies of the strings, and that of the vertices of the vacuum geometry where the graviton lives. Ashtekar et al., (2021) asserted that gravity is simply a manifestation of spacetime geometry. Thus, the graviton cannot be a string boson, however, there is a duality between gravity and strings. Also, gauge bosons have spin-1, while the graviton has spin-2.

Then lastly, because of the thermodynamic constraints we were able to arrive at the results we have, now this bring us to this fundamental question; that string theory and LQG theory are two intrinsic aspects of a complete quantum gravity theory we are after? That is, without the other no complete and compelling quantum geometry can be attained, as it is done here? This need to be investigated further.

3

We have the following expression concerning the ratios (and/or the inverses) between the icosahedron, octahedron and tetrahedron volumes and the sphere volume.

$$\sqrt[2\pi]{\frac{\frac{5}{12}(3+\sqrt{5})d^3}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3} \times \frac{1}{\frac{\frac{1}{3}\sqrt{2}a^3}{\frac{4}{3}\pi\left(\frac{a}{2}\right)^3}} \times \frac{1}{\frac{\sqrt{2}}{12}d^3 \cdot \frac{1}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}}}$$

(we have highlighted the DN Constant in blue)

From the above expression, we obtain the following formulas concerning the icosahedron, octahedron and tetrahedron volumes together to the sphere volume.

$$\sqrt[2\pi]{\frac{5}{12}(3+\sqrt{5})d^3 \times \left(\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\right)^2}$$

and

$$\sqrt[2\pi]{\frac{4}{3}\pi\left(\frac{d}{2}\right)^{3} \times \frac{1}{3}\sqrt{2}d^{3} \times \frac{\sqrt{2}}{12}d^{3}}$$

From the previous expression

$$x = 1 + \frac{\sqrt[3]{\sqrt{699} - 18}}{3^{2/3}} - \frac{5}{\sqrt[3]{3\left(\sqrt{699} - 18\right)}}$$

we obtain:

((1 + (sqrt(699) - 18)^(1/3)/3^(2/3) - 5/(3 (sqrt(699) - 18))^(1/3))) ((5/12 (3+√5) d^3)×((4/3 π(d/2)^3)^2))^(1/(2Pi))

Input

$$\left(1 + \frac{\sqrt[3]{\sqrt{699} - 18}}{3^{2/3}} - \frac{5}{\sqrt[3]{3\left(\sqrt{699} - 18\right)}}\right) \sqrt[2\pi]{\left(\frac{5}{12}\left(3 + \sqrt{5}\right)d^{3}\right)\left(\frac{4}{3}\pi\left(\frac{d}{2}\right)^{3}\right)^{2}}$$

Exact result

$$3^{-3/(2\pi)}\sqrt[2\pi]{5\left(3 + \sqrt{5}\right)}\left(1 + \frac{\sqrt[3]{\sqrt{699} - 18}}{3^{2/3}} - \frac{5}{\sqrt[3]{3\left(\sqrt{699} - 18\right)}}\right)\sqrt[\pi]{\frac{\pi}{4}}\ \sqrt[2\pi]{d^{9}}$$

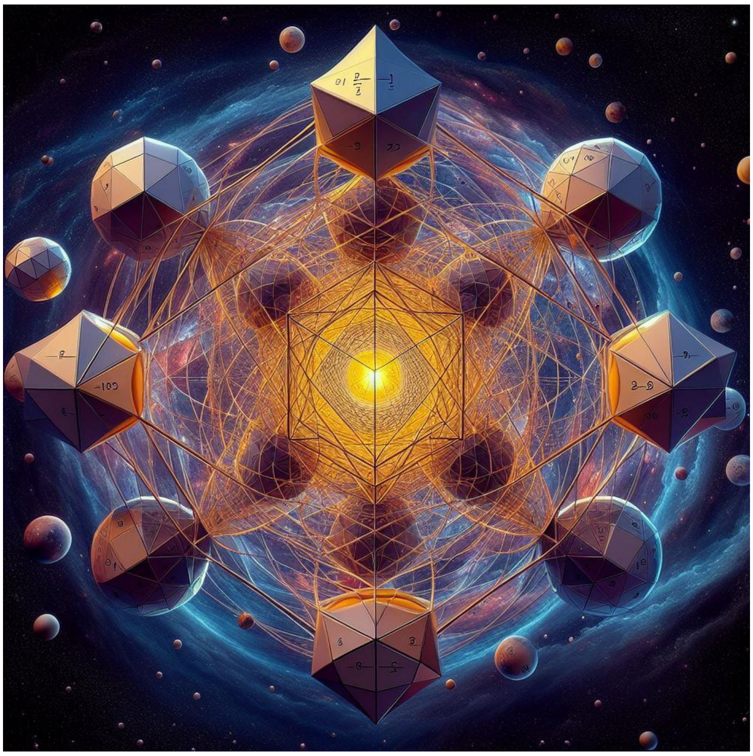

Fig. 1

A geometric representation of the Universe in a scenario of eternal inflation that emerges as a fluctuation from the quantum vacuum, which incorporates the solutions of a quartic equation, the ratios (and/or inverses) between the volumes of the icosahedron, of the octahedron and of the tetrahedron and the volume of the sphere, the ratio $(2\sqrt{2})/\pi$, the so-called Del Gaudio-Nardelli Constant, and the values of the golden ratio and π.

Notes on efficient computation of Ramanujan cubic equations - *Peter J.-S. Shiue, Anthony G. Shannon, Shen C. Huang and Jorge E. Reyes* - Notes on Number Theory and Discrete Mathematics - Print ISSN 1310–5132, Online ISSN 2367–8275 2022, Volume 28, Number 2, Pages 350–375 - DOI: 10.7546/nntdm.2022.28.2.350-375

Wang, inspired by Ramanujan's identities involving cosine functions, investigated similar identities involving sine and tangent functions. By using Ramanujan's theorem and Cardano's formula, he provided various identities. We analyze the following:

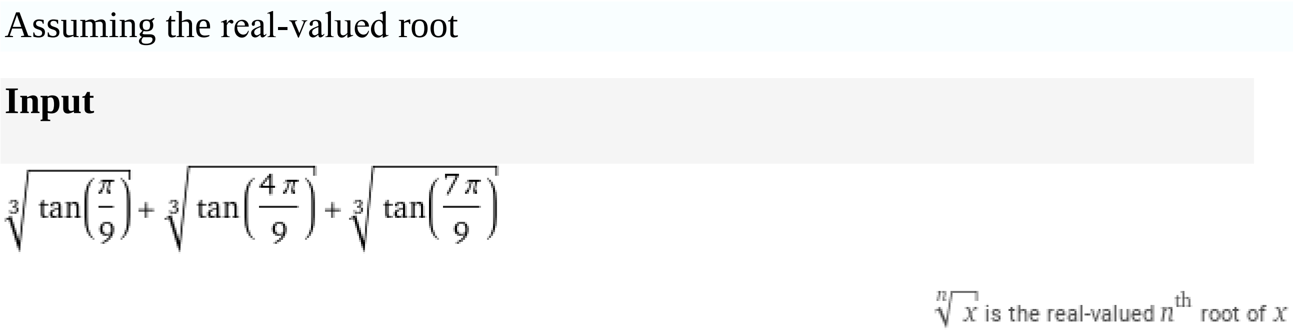
$$\begin{aligned}&\sqrt[3]{\tan\frac{\pi}{9}}+\sqrt[3]{\tan\frac{4\pi}{9}}+\sqrt[3]{\tan\frac{7\pi}{9}}\\&\qquad=\left(-\sqrt[18]{3}\right)\left(\sqrt[3]{-3\sqrt[3]{3}+6+3\left(\sqrt[3]{21-3\left(3\sqrt[3]{3}+\sqrt[3]{9}\right)}-\sqrt[3]{3+3\left(3\sqrt[3]{3}+\sqrt[3]{9}\right)}\right)}\right)\end{aligned}$$

From

$$\begin{aligned}&\sqrt[3]{\tan\frac{\pi}{9}}+\sqrt[3]{\tan\frac{4\pi}{9}}+\sqrt[3]{\tan\frac{7\pi}{9}}\\&\qquad=\left(-\sqrt[18]{3}\right)\left(\sqrt[3]{-3\sqrt[3]{3}+6+3\left(\sqrt[3]{21-3\left(3\sqrt[3]{3}+\sqrt[3]{9}\right)}-\sqrt[3]{3+3\left(3\sqrt[3]{3}+\sqrt[3]{9}\right)}\right)}\right)\end{aligned}$$

we obtain:

(tan(Pi/9))^(1/3)+(tan((4Pi)/9))^(1/3)+(tan((7Pi)/9))^(1/3)



Assuming the real-valued root

Input

$$\sqrt[3]{\tan\left(\frac{\pi}{9}\right)}+\sqrt[3]{\tan\left(\frac{4\,\pi}{9}\right)}+\sqrt[3]{\tan\left(\frac{7\,\pi}{9}\right)}$$

$\sqrt[n]{x}$ is the real-valued n^{th} root of x

Exact result

$$\sqrt[3]{\tan\left(\frac{\pi}{9}\right)} - \sqrt[3]{\tan\left(\frac{2\pi}{9}\right)} + \sqrt[3]{\cot\left(\frac{\pi}{18}\right)}$$

$\cot(x)$ is the cotangent function

Decimal approximation

Minimal polynomial

$$x^{54} + 243x^{48} + 750141x^{42} + 125492247x^{36} + 8402613651x^{30} - 1564600036311x^{24} + 76244538770991x^{18} - 809985827659635x^{12} + 249709551662016x^6 - 42845606719488$$

The minimal polynomial of α is the irreducible polynomial with rational coefficients of smallest degree with α as a root »

We have the following expression concerning the ratios (and/or the inverses) between the icosahedron, octahedron and tetrahedron volumes and the sphere volume.

$$\sqrt[2\pi]{\frac{\frac{5}{12}(3+\sqrt{5})d^3}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3} \times \frac{1}{\frac{\frac{1}{3}\sqrt{2}a^3}{\frac{4}{3}\pi\left(\frac{a}{2}\right)^3}} \times \frac{1}{\frac{\sqrt{2}}{12}d^3 \cdot \frac{1}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}}}$$

(we have highlighted the DN Constant in blue)

From the above expression, we obtain the following formulas concerning the icosahedron, octahedron and tetrahedron volumes together to the sphere volume.

$$\sqrt[2\pi]{\frac{5}{12}(3+\sqrt{5})d^3 \times \left(\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\right)^2}$$

and

$$\sqrt[2\pi]{\frac{4}{3}\pi\left(\frac{d}{2}\right)^{3}\times\frac{1}{3}\sqrt{2}d^{3}\times\frac{\sqrt{2}}{12}d^{3}}$$

From the previous result

$$-\sqrt[18]{3}\sqrt[3]{6-3\sqrt[3]{3}+3\left(\sqrt[3]{21-3\left(3\sqrt[3]{3}+3^{2/3}\right)}-\sqrt[3]{3+3\left(3\sqrt[3]{3}+3^{2/3}\right)}\right)}$$

we obtain:

(-3^(1/18) (6 - 3 3^(1/3) + 3 ((21 - 3 (3 3^(1/3) + 3^(2/3)))^(1/3) - (3 + 3 (3 3^(1/3) + 3^(2/3)))^(1/3)))^(1/3)) ((5/12 (3+√5) d^3)×((4/3 π(d/2)^3)^2))^(1/(2Pi))

Input

$$\left(-\sqrt[18]{3}\sqrt[3]{6-3\sqrt[3]{3}+3\left(\sqrt[3]{21-3\left(3\sqrt[3]{3}+3^{2/3}\right)}-\sqrt[3]{3+3\left(3\sqrt[3]{3}+3^{2/3}\right)}\right)}\right)\sqrt[2\pi]{\left(\frac{5}{12}\left(3+\sqrt{5}\right)d^{3}\right)\left(\frac{4}{3}\pi\left(\frac{d}{2}\right)^{3}\right)^{2}}$$

Exact result

$$-3^{1/18-3/(2\pi)}\times4^{-1/\pi}\sqrt[2\pi]{5\left(3+\sqrt{5}\right)}\sqrt[3]{6-3\sqrt[3]{3}+3\left(\sqrt[3]{21-3\left(3\sqrt[3]{3}+3^{2/3}\right)}-\sqrt[3]{3+3\left(3\sqrt[3]{3}+3^{2/3}\right)}\right)}\sqrt[\pi]{\pi}\sqrt[2\pi]{d^{9}}$$

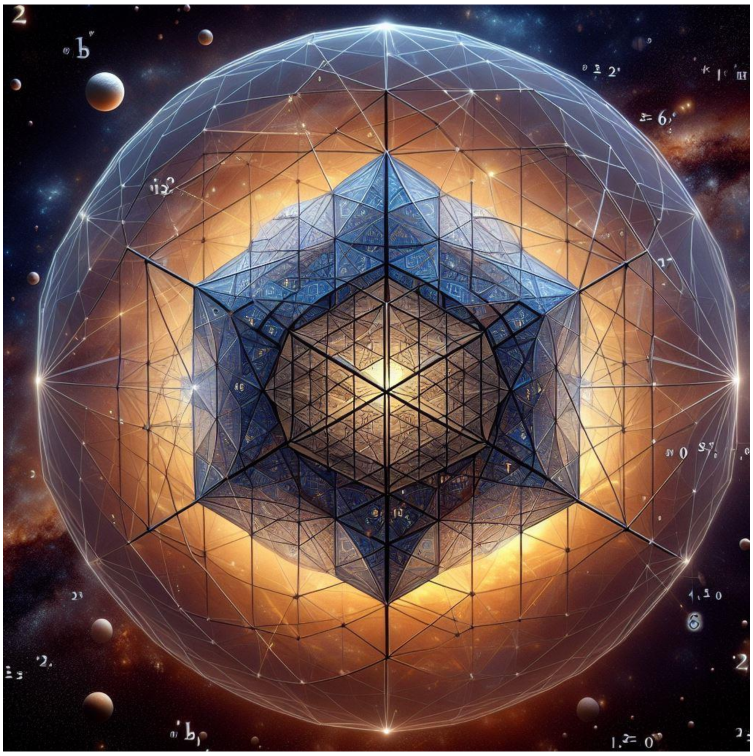

Fig. 2

A geometric representation of the Universe in a scenario of eternal inflation that emerges as a fluctuation from the quantum vacuum, which incorporates the solutions of Ramanujan's cubic equations, multiplying the solutions of these equations or the equations themselves, by the formula relating to the ratios (and/ or the inverses) between the volumes of the icosahedron, the octahedron and the tetrahedron and the volume of the sphere, where this formula includes the ratio (2√2)/π, the so-called Del Gaudio-Nardelli Constant, whose result is very close to the values of the golden ratio and π.

Fig. 3

It was hypothesized that the solutions of Ramanujan's cubic equations which are related to the cubic equations solvable with the Cardano method and Padovan's recurrence relations, are boundary conditions to deepen the understanding of the formation of the bubbles of the universe with eternal inflation and an octahedron which could represent a mathematical or conceptual model of the primordial universe before the Big Bang. Finally, regarding cubic equations, they could represent the geometric characteristics of the quantum vacuum, while the spherical surface would represent the geometry of the universe bubble. We propose that the results obtained by multiplying the solution of the cubic equation by a formula relating the ratios (and/or inverses) between the volumes of the icosahedron, octahedron and tetrahedron and the volume of the sphere. including the ratio (2sqrt2)/Pi, the result of which provides the golden ratio and Pigreco, can be connected to the cosmological model described above.

On the application of the formulas of the volumes of an octahedron and a sphere

With regard to a sphere inscribed in an octahedron, we have the following formulas.

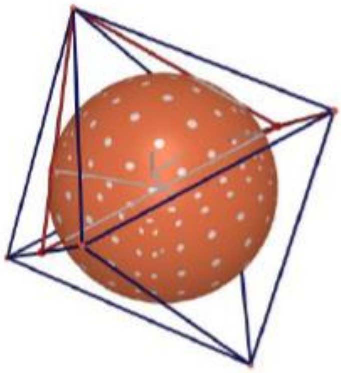

Fig: sphere inscribed in an octahedron

$V_0 = \frac{1}{3}\sqrt{2}\, l^3$

$V_s = \frac{4}{3}\pi r^3$; where $r_s = (l/2)$

With regard the ratio between the two above formulas (octahedron and sphere)

(1/3*√2*l^3)/(4/3*π*(l/2)^3)

we obtain:

Input

$$\frac{\frac{1}{3}\sqrt{2}\, l^3}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^3}$$

Result

$$\frac{\sqrt{2}\ 2}{\pi} \quad (\text{for } l \neq 0)$$

$$6\pi\sqrt{2}\times\frac{\frac{1}{3}\sqrt{2}\,l^3}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^3}$$

Exact result

24

24

The value 24 is linked to the "Ramanujan function" (an elliptic modular function that satisfies the need for "conformal symmetry") that has 24 "modes" corresponding to the physical vibrations of a bosonic string representing a bosons. From the analysis, we observe that the is no number theoretic connection with physical vibrations of fermionic strings at extremally low entropy. This fact is confirmed by the fact that the Higgs bosons at the moment of the big bang and infinitesimally shortly thereafter, facilitated the creation of fermions (matter and antimatter particles) [8]. Thus we note that the ingredients for the formation of electromagnetic radiation from photons (a Boson), and the formation of matter from the Higgs boson after the big bang, are intrinsic properties of the vacuum energy in pre-big bang.

Series representations

$$\frac{(6\pi\sqrt{2})(\sqrt{2}\,l^3)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3}=12\sqrt{z_0}^{2}\left(\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(2-z_0)^k\,z_0^{-k}}{k!}\right)^2$$

for (not ($z_0 \in \mathbb{R}$ and $-\infty < z_0 \le 0$))

$$\frac{(6\pi\sqrt{2})(\sqrt{2}\,l^3)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3} = 12\exp^2\left(i\pi\left\lfloor\frac{\arg(2-x)}{2\pi}\right\rfloor\right)\sqrt{x}^2\left(\sum_{k=0}^{\infty}\frac{(-1)^k(2-x)^k x^{-k}\left(-\frac{1}{2}\right)_k}{k!}\right)^2$$

for ($x \in \mathbb{R}$ and $x < 0$)

$$\frac{(6\pi\sqrt{2})(\sqrt{2}\,l^3)}{\frac{1}{3}\left(4\pi\left(\frac{l}{2}\right)^3\right)3} =$$

$$12\left(\frac{1}{z_0}\right)^{\lfloor\arg(2-z_0)/(2\pi)\rfloor} z_0^{1+\lfloor\arg(2-z_0)/(2\pi)\rfloor}\left(\sum_{k=0}^{\infty}\frac{(-1)^k\left(-\frac{1}{2}\right)_k(2-z_0)^k z_0^{-k}}{k!}\right)^2$$

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x\rfloor$ is the floor function

i is the imaginary unit

This could imply that all matter (fermions) was preceded by bosons. That is, before the Big Bang, from perturbations of the vacuum energy itself, bosons were created, and successively at the Big Bang, and infinitesimally shortly after the Big Bang, fermions, were created from the vacuum energy that underwent a violent “breaking” that formed a hot plasma. of particle-antiparticle pairs. This therefore implies that quantum gravity was not necessarily “dark” to some extent, because a photon (light particle) is itself a boson. Therefore, a big bang was not necessarily the moment of the creation of light, but of the creation of matter (fermions) from vacuum energy, as this undergoes further "breaking" in the cosmological constant, in the hot plasma of matter and in the energy dark.

Indeed:

From:

https://www.academia.edu/75787512/The_Theory_of_String_A_Candidate_for_a_Generalized_Unification_Model

The Einstein's field equation and the String Theory.

The Einstein's field equation which includes the cosmological constant is:

$$R_{\mu\nu} - \frac{1}{2} g_{\mu\nu} R - \lambda g_{\mu\nu} = -8\pi \mathrm{G} \mathrm{T}_{\mu\nu} \quad (8)$$

where $R_{\mu\nu}$ is the Ricci tensor, R its trace, λ the cosmological constant, $g_{\mu\nu}$ the metric tensor of the space geometry, G the Newton's gravitational constant and $T_{\mu\nu}$ the tensor representing the properties of energy, matter and momentum.

The left hand-side of (8) represents the gravitational field and, consequently, the warped space-time, while the right hand-side represents the matter, i.e. the sources of the gravitational field.

In string theory the gravity is related to the gravitons which are bosons, whereas the matter is related to fermions. It follows that the left and right hand of (8) may be respectively related to the action of bosonic and of superstrings.

The actions of bosonic string and superstring (also containing fermions) are connected by the Palumbo-Nardelli relation (Palumbo et al. 2005):

$$-\int d^{26}x\sqrt{g}\left[-\frac{R}{16\pi G}-\frac{1}{8}g^{\mu\rho}g^{\nu\sigma}Tr\left(G_{\mu\nu}G_{\rho\sigma}\right)f(\varphi)-\frac{1}{2}g^{\mu\nu}\partial_{\mu}\varphi\partial_{\nu}\varphi\right]=$$

$$=\int_{0}^{\infty}\frac{1}{2\kappa_{10}^{2}}\int d^{10}x\sqrt{-G}e^{-2\Phi}\left[R+4\partial_{\mu}\Phi\partial^{\mu}\Phi-\frac{1}{2}|\widetilde{H}_{3}|^{2}-\frac{\kappa_{10}^{2}}{g_{10}^{2}}Tr_{\nu}\left(|F_{2}|^{2}\right)\right]$$

The sign minus in the above equation comes from the inversion of any relationship.

(2π*√2((1/3*√2*l^3)/(4/3*π*(l/2)^3)))^4

Input

$$\left(2\pi\sqrt{2}\times\frac{\frac{1}{3}\sqrt{2}\,l^{3}}{\frac{4}{3}\pi\left(\frac{l}{2}\right)^{3}}\right)^{4}$$

Exact result

4096

$4096 = 64^2$, (Ramanujan Recurring Number) that multiplied by 2 give 8192, indeed:

The total amplitude vanishes for gauge group SO(8192), while the vacuum energy is negative and independent of the gauge group. The vacuum energy and dilaton tadpole to lowest non-trivial order for the open bosonic string. While the vacuum energy is non-zero and independent of the gauge group, the dilaton tadpole is zero for a unique choice of gauge group, SO(2^{13}) i.e. SO(8192). (From: “Dilaton Tadpole for the Open Bosonic String “ Michael R. Douglas and Benjamin Grinstein - September 2,1986)

27*sqrt((2π*√2((1/3*√2*l^3)/(4/3*π*(l/2)^3)))^4)+1

$n!$ is the factorial function

$(a)_n$ is the Pochhammer symbol (rising factorial)

$\mathbb{R}$ is the set of real numbers

$\arg(z)$ is the complex argument

$\lfloor x\rfloor$ is the floor function

i is the imaginary unit

Integral representation

$$(1+z)^a = \frac{\int_{-i\,\infty+\gamma}^{i\,\infty+\gamma}\frac{\Gamma(s)\,\Gamma(-a-s)}{z^s}\,ds}{(2\,\pi\,i)\,\Gamma(-a)} \quad \text{for } (0<\gamma<-\text{Re}(a) \text{ and } |\arg(z)|<\pi)$$

$\Gamma(x)$ is the gamma function

$\text{Re}(z)$ is the real part of z

$|z|$ is the absolute value of z

From the above expression, we obtain the following formulas concerning the icosahedron, octahedron and tetrahedron volumes together to the sphere volume.

$$\sqrt[2\pi]{\frac{5}{12}(3+\sqrt{5})d^3 \times \left(\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\right)^2}$$

and

$$\sqrt[2\pi]{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3 \times \frac{1}{3}\sqrt{2}d^3 \times \frac{\sqrt{2}}{12}d^3}$$

Indeed, we obtain:

$$\frac{\sqrt[2\pi]{\frac{5}{12}\left(3+\sqrt{5}\right)\left(d^3\left(\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\right)^2\right)}}{\sqrt[2\pi]{\frac{4}{3}\left(\pi\left(\frac{d}{2}\right)^3 \times \frac{1}{3}\right)\sqrt{2}\left(d^3 \times \frac{\sqrt{2}}{12}\right)d^3}}$$

= 1.618008545900107…

Furthermore, from the formula

$$2^{-1/\pi}\sqrt[2\pi]{5\left(3+\sqrt{5}\right)\pi}$$

we obtain also:

(4 (1.6180085459)^(2 π))/(5 (3 + sqrt(5)))

$$\frac{4 \times 1.6180085459^{2\pi}}{5\left(3+\sqrt{5}\right)}$$

3.1415926535884871624221932509858715278931025189245576170078100613

…

3.1415926535…. = π (Ramanujan Recurring Number)

In conclusion, from the following further formula concerning the tetrahedron, the cube, the octahedron, the dodecahedron and the icosahedron volumes and their ratios (and/or the inverses) with the sphere volume, raised the expression

$$(2\log(2) log^{2/3}(3^2))/(3e^{7/3})$$

$$\left(\frac{\frac{5}{12}\left(3+\sqrt{5}\right)d^3}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3} \times \frac{a^3}{\frac{4}{3}\pi\left(\frac{a}{2}\right)^3} \times \frac{1}{\frac{\frac{1}{3}\sqrt{2}\,a^3}{\frac{4}{3}\pi\left(\frac{a}{2}\right)^3}} \times \frac{1}{\frac{\sqrt{2}}{12}d^3 \times \frac{1}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}} \times \frac{\frac{1}{4}\left(\left(15+7\sqrt{5}\right)d^3\right)}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3} \right)^{(2\log(2)\log^{2/3}(3^2))/(3e^{7/3})}$$

i.e.

$$\left(\frac{3}{2}\right)^{(4\log(2)\log^{2/3}(9))/(3e^{7/3})} \left(\frac{5\left(3+\sqrt{5}\right)\left(15+7\sqrt{5}\right)}{\pi}\right)^{(2\log(2)\log^{2/3}(9))/(3e^{7/3})}$$

we obtain:

1.6180381711519139857456817084743134673903021614989370712917722071

...

1.6180381711…. result that is a very good approximation to the value of the golden ratio 1.618033988749… (Ramanujan Recurring Number)

Observations

We note that, from the number 8, we obtain as follows:

8^2

64

$8^2 \times 2 \times 8$

1024

$8^4 = 8^2 \times 2^6$

True

$8^4 = 4096$

$8^2 \times 2^6 = 4096$

$2^{13} = 2 \times 8^4$

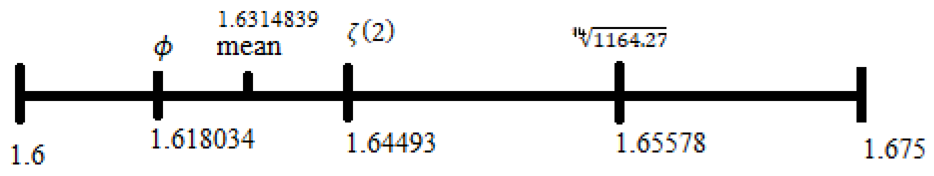
True

$2^{13} = 8192$

$2 \times 8^4 = 8192$

We notice how from the numbers 8 and 2 we get 64, 1024, 4096 and 8192, and that 8 is the fundamental number. In fact $8^2 = 64$, $8^3 = 512$, $8^4 = 4096$. We define it "fundamental number", since 8 is a Fibonacci number, which by rule, divided by the previous one, which is 5, gives 1.6 , a value that tends to the golden ratio, as for all numbers in the Fibonacci sequence

“Golden” Range

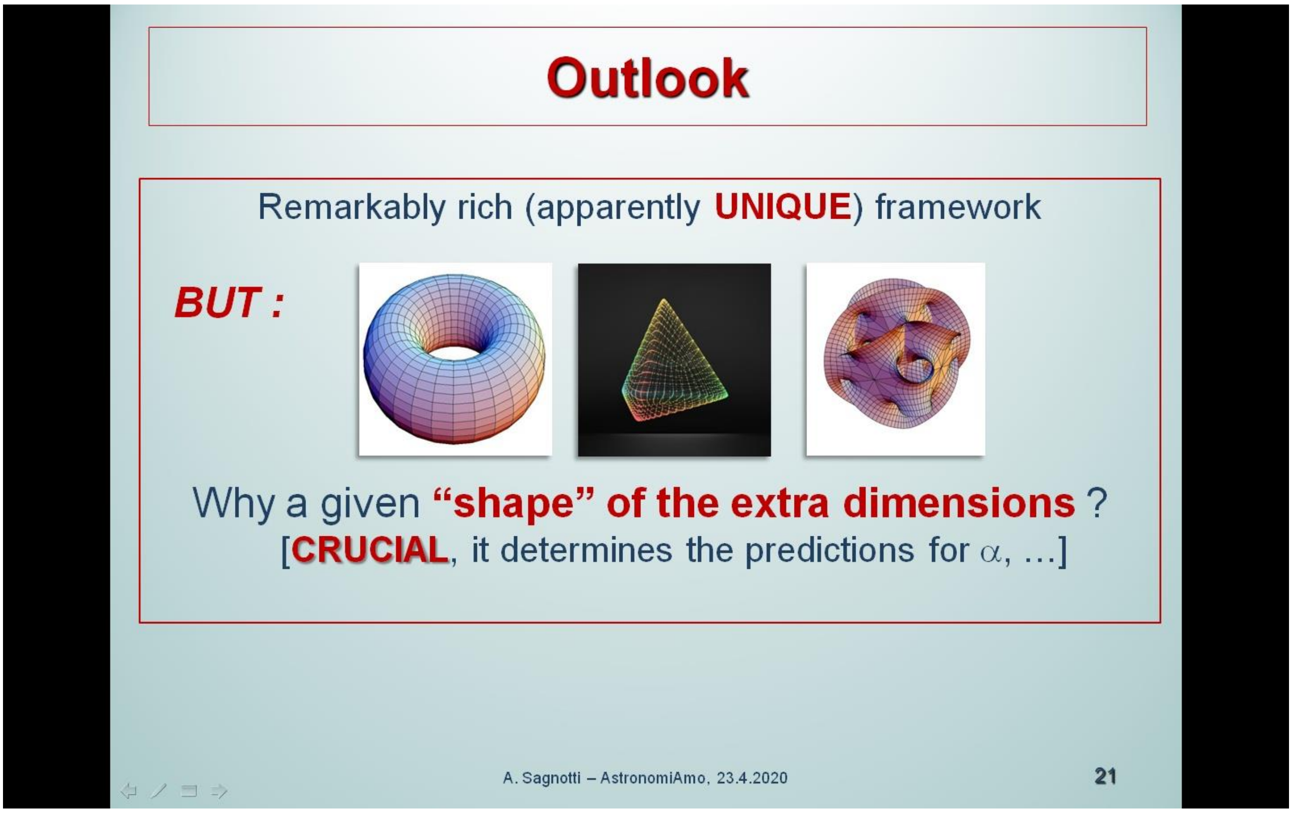


1.6314839
ϕ
mean
$\zeta(2)$
$\sqrt[14]{1164.27}$
1.6
1.618034
1.64493
1.65578
1.675

Finally we note how $8^2 = 64$, multiplied by 27, to which we add 1, is equal to 1729, the so-called "Hardy-Ramanujan number". Then taking the 15th root of 1729, we obtain a value close to $\zeta(2)$ that 1.6438 ..., which, in turn, is included in the range of what we call "golden numbers"

Furthermore for all the results very near to 1728 or 1729, adding $64 = 8^2$, one obtain values about equal to 1792 or 1793. These are values almost equal to the Planck multipole spectrum frequency 1792.35 and to the hypothetical Gluino mass

Appendix



Outlook

Remarkably rich (apparently **UNIQUE**) framework

BUT :

Why a given **"shape" of the extra dimensions** ?

[**CRUCIAL**, it determines the predictions for α, …]

A. Sagnotti – AstronomiAmo, 23.4.2020

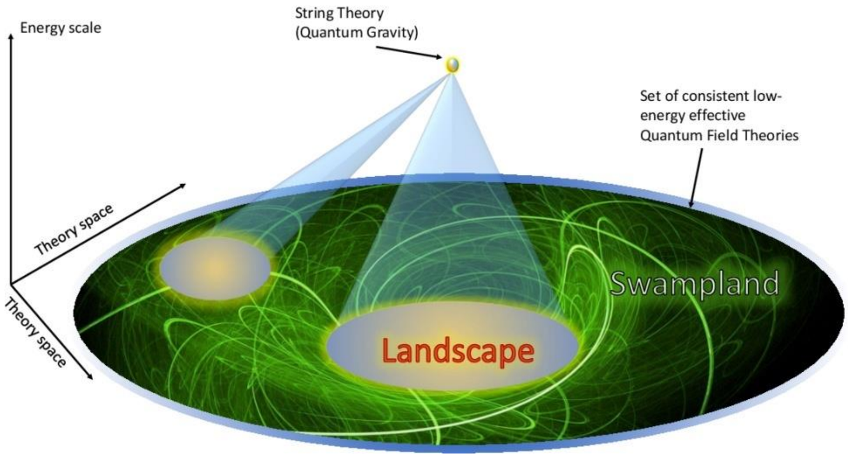
21

From: *A. Sagnotti – AstronomiAmo, 23.04.2020*

In the above figure, it is said that: "why a given shape of the extra dimensions? Crucial, it determines the predictions for α".

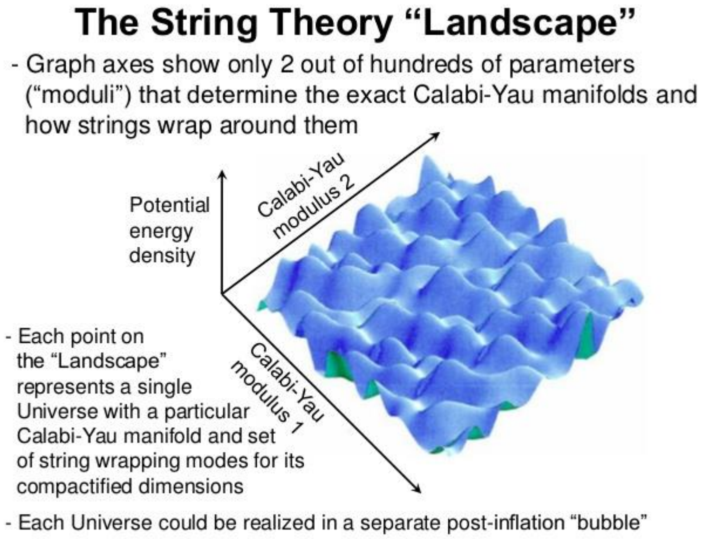
We propose that whatever shape the compactified dimensions are, their geometry must be based on the values of the golden ratio and ζ(2), (the latter connected to 1728 or 1729, whose fifteenth root provides an excellent approximation to the above mentioned value) which are recurrent as solutions of the equations that we are going to develop. It is important to specify that the initial conditions are **always** values belonging to a fundamental chapter of the work of S. Ramanujan "Modular equations and Approximations to Pi" (see references). These values are some multiples of 8 (64 and 4096), 276, which added to 4096, is equal to 4372, and finally $e^{\pi\sqrt{22}}$

We have, in certain cases, the following connections:



Energy scale
String Theory
(Quantum Gravity)
Set of consistent low-energy effective Quantum Field Theories
Theory space
Theory space
Swampland
Landscape

Fig. 1



The String Theory "Landscape"

- Graph axes show only 2 out of hundreds of parameters ("moduli") that determine the exact Calabi-Yau manifolds and how strings wrap around them

- Each point on the "Landscape" represents a single Universe with a particular Calabi-Yau manifold and set of string wrapping modes for its compactified dimensions

- Each Universe could be realized in a separate post-inflation "bubble"

Potential energy density
Calabi-Yau modulus 2
Calabi-Yau modulus 1

Fig. 2

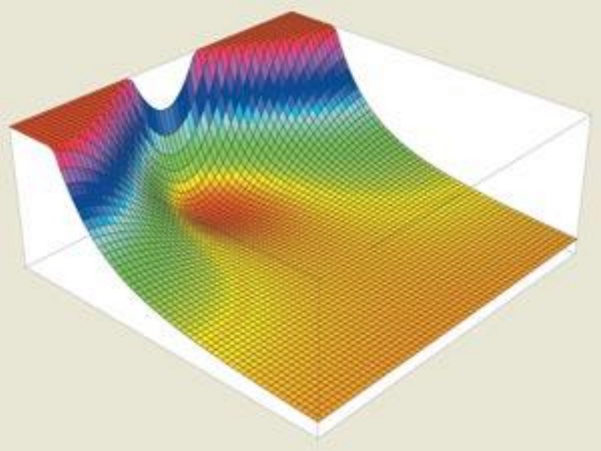


Fig. 3

Stringscape - a small part of the string-theory landscape showing the new de Sitter solution as a local minimum of the energy (vertical axis). The global minimum occurs at the infinite size of the extra dimensions on the extreme right of the figure.

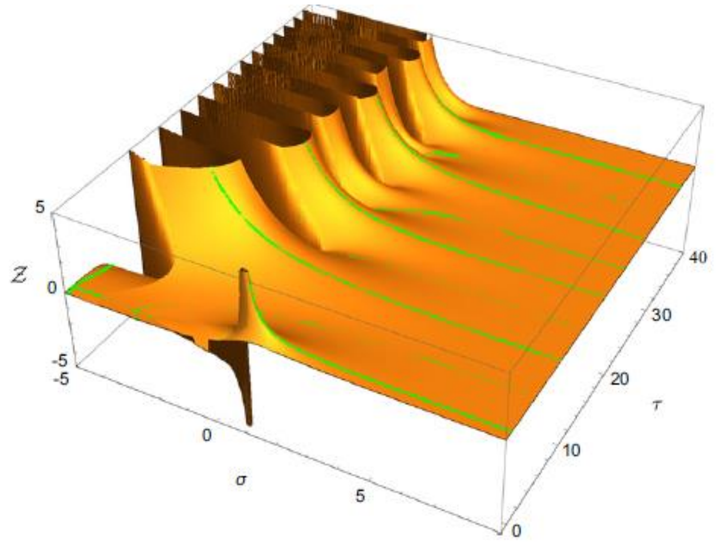

Figure 2. Lines in the complex plane where the Riemann zeta function ζ is real (green) depicted on a relief representing the positive absolute value of ζ for arguments $s \equiv \sigma + \mathrm{i}\tau$ where the real part of ζ is positive, and the negative absolute value of ζ where the real part of ζ is negative. This representation brings out most clearly that the lines of constant phase corresponding to phases of integer multiples of 2π run down the hills on the left-hand side, turn around on the right and terminate in the non-trivial zeros. This pattern repeats itself infinitely many times. The points of arrival and departure on the right-hand side of the picture are equally spaced and given by equation (11).

Fig. 4

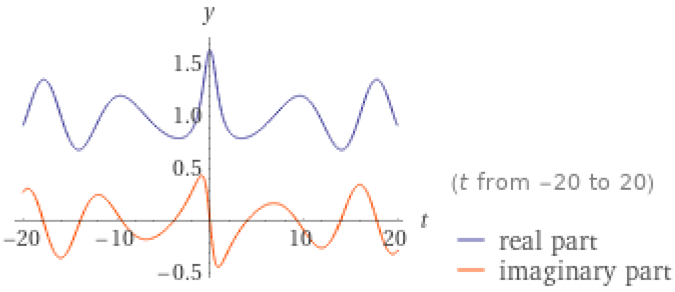
Input

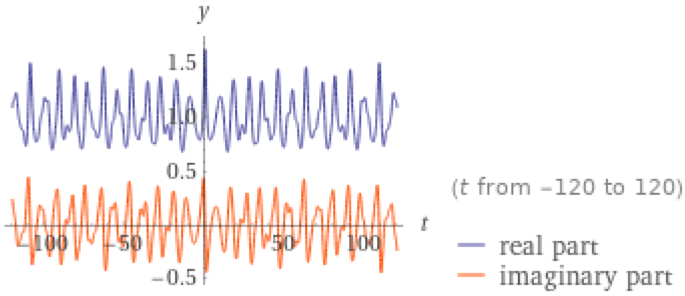
$\zeta(2+i\,t)$

$\zeta(s)$ is the Riemann zeta function

i is the imaginary unit

Plots





Roots

$t = 2\,i\,(n+1)\,,\quad n \in \mathbb{Z}\,,\quad n \geq 1$

$t = -i\,(\rho_n - 2)\,,\quad n \neq 0\,,\quad n \in \mathbb{Z}$

$\mathbb{Z}$ is the set of integers

ρ_n is the nontrivial n^{th} zero of the Riemann zeta function

Series expansion at t=0

$$\frac{\pi^2}{6} + i\,t\,\zeta'(2) - \frac{1}{2}\,t^2\,\zeta''(2) - \frac{1}{6}\,i\,\zeta^{(3)}(2)\,t^3 + \frac{1}{24}\,\zeta^{(4)}(2)\,t^4 + O\!\left(t^5\right)$$

(Taylor series)

Alternative representations

$$\zeta(2 + i\,t) = \zeta(2 + i\,t, 1)$$

.

$$\zeta(2 + i\,t) = S_{1+i\,t,1}(1)$$

.

$$\zeta(2 + i\,t) = \frac{\zeta\left(2 + i\,t, \frac{1}{2}\right)}{-1 + 2^{2+i\,t}}$$

$\zeta(s, a)$ is the generalized Riemann zeta function

$S_{n,p}(x)$ is the Nielsen generalized polylogarithm function

Series representations

$$\zeta(2 + i\,t) = \sum_{k=1}^{\infty} k^{-2-i\,t} \quad \text{for } \operatorname{Im}(t) < 1$$

.

$$\zeta(2 + i\,t) = \frac{\sum_{k=0}^{\infty} (1 + 2\,k)^{-2-i\,t}}{1 - 2^{-2-i\,t}} \quad \text{for } \operatorname{Im}(t) < 1$$

.

$$\zeta(2 + i\,t) = e^{\sum_{k=1}^{\infty} P(k\,(2+i\,t))/k} \quad \text{for } \operatorname{Im}(t) < 1$$

$\operatorname{Im}(z)$ is the imaginary part of z

$P(z)$ gives the prime zeta function

Integral representations

$$\zeta(2+i\,t)=\frac{1}{\Gamma(2+i\,t)}\int_0^\infty \frac{\tau^{1+i\,t}}{-1+e^{\tau}}\,d\tau \quad \text{for } \operatorname{Im}(t)<1$$

$$\zeta(2+i\,t)=\frac{2^{1+i\,t}}{\Gamma(3+i\,t)}\int_0^\infty \tau^{2+i\,t}\operatorname{csch}^2(\tau)\,d\tau \quad \text{for } \operatorname{Im}(t)<1$$

$$\zeta(2+i\,t)=\frac{2^{1+i\,t}}{\Gamma(2+i\,t)}\int_0^\infty e^{-\tau}\,\tau^{1+i\,t}\operatorname{csch}(\tau)\,d\tau \quad \text{for } \operatorname{Im}(t)<1$$

$\Gamma(x)$ is the gamma function

$\operatorname{csch}(x)$ is the hyperbolic cosecant function

Functional equations

$$\zeta(2+i\,t)=-i\,2^{2+i\,t}\,\pi^{1+i\,t}\,\Gamma(-1-i\,t)\sinh\left(\frac{\pi\,t}{2}\right)\zeta(-1-i\,t)$$

$$\zeta(2+i\,t)=\frac{\pi^{3/2+i\,t}\,\Gamma\left(-\frac{1}{2}-\frac{i\,t}{2}\right)\zeta(-1-i\,t)}{\Gamma\left(1+\frac{i\,t}{2}\right)}$$

$$\zeta(2+i\,t)=-\frac{i\sum_{k=0}^{\infty}\frac{\Gamma\left(k-\frac{i\,t}{2}\right)\sum_{j=0}^{k}(-1)^j\,(1+2\,j)\binom{k}{j}\zeta(2+2\,j)}{k!}}{(-i+t)\,\Gamma\left(-\frac{i\,t}{2}\right)}$$

With regard the Fig. 4 the points of arrival and departure on the right-hand side of the picture are equally spaced and given by the following equation:

$$\tau'_k \equiv k\,\frac{\pi}{\ln 2},$$

with $k = \ldots, -2, -1, 0, 1, 2, \ldots.$

we obtain:

2Pi/(ln(2))

Input:

$$2\times\frac{\pi}{\log(2)}$$

Exact result:

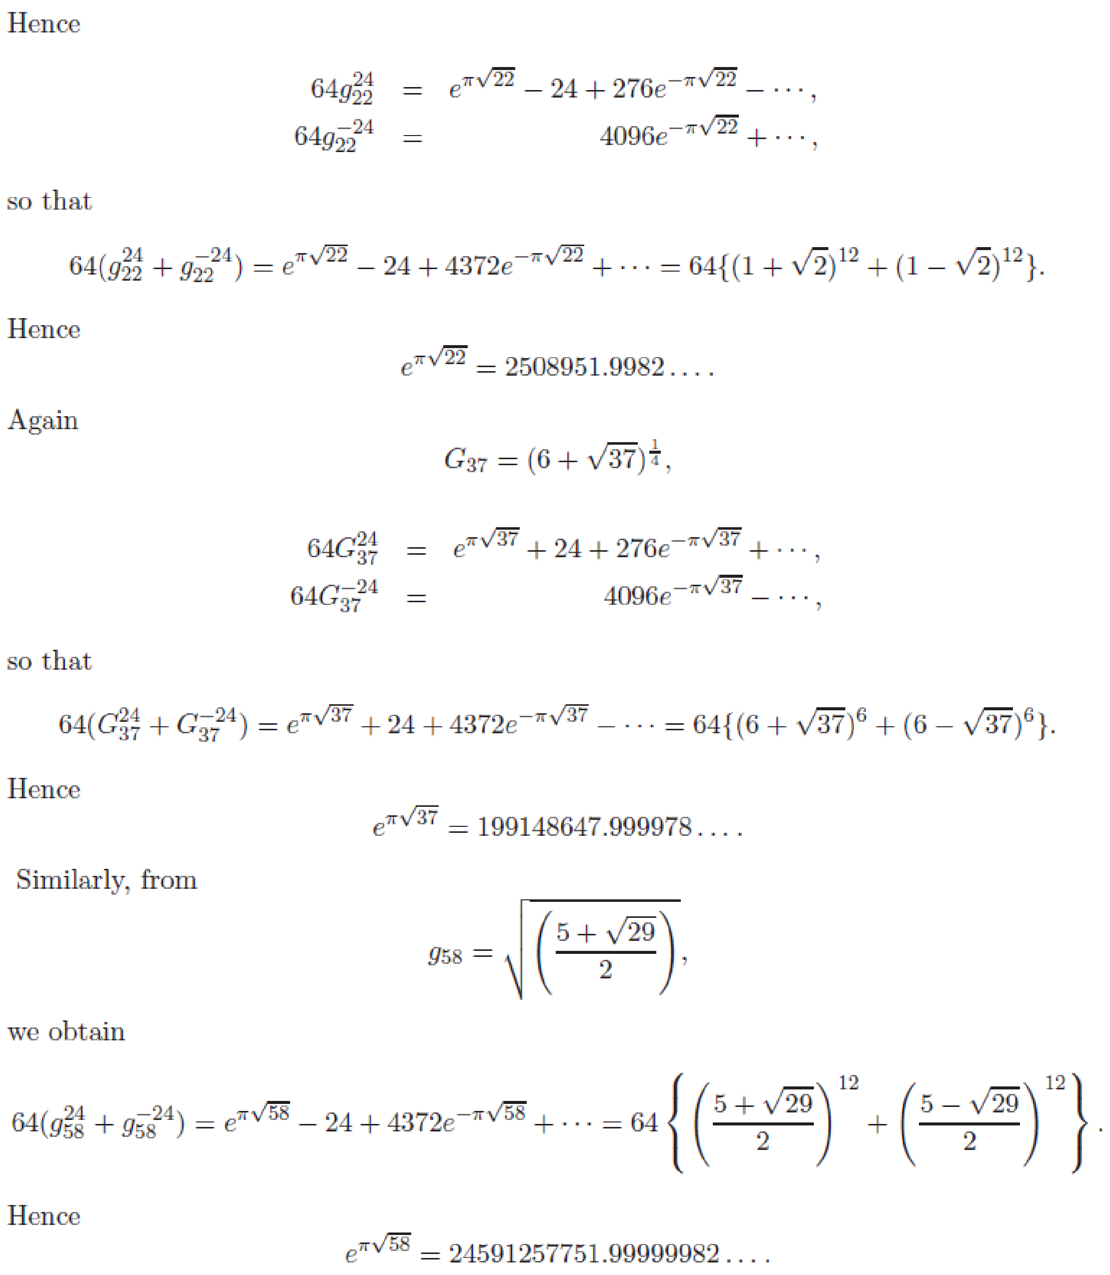
1.6449340668…. = ζ(2) = $\frac{\pi^2}{6}$ = 1.644934 ...

From:

Modular equations and approximations to π - *Srinivasa Ramanujan* - Quarterly Journal of Mathematics, XLV, 1914, 350 – 372

We have that:



Hence

$$\begin{aligned} 64g_{22}^{24} &= e^{\pi\sqrt{22}} - 24 + 276e^{-\pi\sqrt{22}} - \cdots, \\ 64g_{22}^{-24} &= 4096e^{-\pi\sqrt{22}} + \cdots, \end{aligned}$$

so that

$$64(g_{22}^{24} + g_{22}^{-24}) = e^{\pi\sqrt{22}} - 24 + 4372e^{-\pi\sqrt{22}} + \cdots = 64\{(1+\sqrt{2})^{12} + (1-\sqrt{2})^{12}\}.$$

Hence

$$e^{\pi\sqrt{22}} = 2508951.9982\ldots.$$

Again

$$G_{37} = (6+\sqrt{37})^{\frac{1}{4}},$$

$$\begin{aligned} 64G_{37}^{24} &= e^{\pi\sqrt{37}} + 24 + 276e^{-\pi\sqrt{37}} + \cdots, \\ 64G_{37}^{-24} &= 4096e^{-\pi\sqrt{37}} - \cdots, \end{aligned}$$

so that

$$64(G_{37}^{24} + G_{37}^{-24}) = e^{\pi\sqrt{37}} + 24 + 4372e^{-\pi\sqrt{37}} - \cdots = 64\{(6+\sqrt{37})^{6} + (6-\sqrt{37})^{6}\}.$$

Hence

$$e^{\pi\sqrt{37}} = 199148647.999978\ldots.$$

Similarly, from

$$g_{58} = \sqrt{\left(\frac{5+\sqrt{29}}{2}\right)},$$

we obtain

$$64(g_{58}^{24} + g_{58}^{-24}) = e^{\pi\sqrt{58}} - 24 + 4372e^{-\pi\sqrt{58}} + \cdots = 64\left\{\left(\frac{5+\sqrt{29}}{2}\right)^{12} + \left(\frac{5-\sqrt{29}}{2}\right)^{12}\right\}.$$

Hence

$$e^{\pi\sqrt{58}} = 24591257751.99999982\ldots.$$

We note that, with regard 4372, we can to obtain the following results:

27((4372)^1/2-2-1/2(((√(10-2√5) -2))⁄((√5-1))))+φ

Input

$$27\left(\sqrt{4372}-2-\frac{1}{2}\times\frac{\sqrt{10-2\sqrt{5}}-2}{\sqrt{5}-1}\right)+\phi$$

ϕ is the golden ratio

Result

$$\phi+27\left(-2+2\sqrt{1093}-\frac{\sqrt{10-2\sqrt{5}}-2}{2\left(\sqrt{5}-1\right)}\right)$$

Decimal approximation

1729.052694417090562517063720863714876368418930653845785481544702 3…

This result is very near to the mass of candidate glueball **f_0(1710) scalar meson.** Furthermore, 1728 occurs in the algebraic formula for the j-invariant of an elliptic curve. ($1728 = 8^2 * 3^3$) The number 1728 is one less than the Hardy–Ramanujan number 1729 (taxicab number)

An Update on Brane Supersymmetry Breaking - *J. Mourad and A. Sagnotti* - arXiv:1711.11494v1 [hep-th] 30 Nov 2017

From the following vacuum equations:

$$T\, e^{\gamma_E\, \phi} \;=\; -\,\frac{\beta_E^{(p)}\, h^2}{\gamma_E}\; e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}$$

$$16\, k'\, e^{-2C} \;=\; \frac{h^2\left(p\,+\,1\,-\,\frac{2\,\beta_E^{(p)}}{\gamma_E}\right) e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}}{(7\,-\,p)}$$

$$(A')^2 \;=\; k\, e^{-2\,A} \;+\; \frac{h^2}{16(p\,+\,1)}\left(7\,-\,p\,+\,\frac{2\,\beta_E^{(p)}}{\gamma_E}\right) e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}$$

we have obtained, from the results almost equals of the equations, putting

$4096\, e^{-\pi\sqrt{18}}$ instead of

$$e^{-2\,(8-p)\,C+2\,\beta_E^{(p)}\,\phi}$$

a new possible mathematical connection between the two exponentials. Thence, also the values concerning p, C, β_E and ϕ correspond to the exponents of e (i.e. of exp). Thence we obtain for p = 5 and $\beta_E = 1/2$:

$$e^{-6C+\phi} = 4096 e^{-\pi\sqrt{18}}$$

Therefore, with respect to the exponentials of the vacuum equations, the Ramanujan's exponential has a coefficient of 4096 which is equal to 64^2, while $-6C+\phi$ is equal to $-\pi\sqrt{18}$. From this it follows that it is possible to establish mathematically, the dilaton value.

For

exp((-Pi*sqrt(18)) we obtain:

Input:

$$\exp\left(-\pi\sqrt{18}\right)$$

Exact result:

$$e^{-3\sqrt{2}\,\pi}$$

Decimal approximation:

1.6272016226072509292942156739117979541838581136954016... × 10^{-6}

1.6272016… * 10^{-6}

Property:

$e^{-3\sqrt{2}\,\pi}$ is a transcendental number

Series representations:

$$e^{-\pi\sqrt{18}} = e^{-\pi\sqrt{17}\sum_{k=0}^{\infty}17^{-k}\binom{1/2}{k}}$$

$$e^{-\pi\sqrt{18}} = \exp\left(-\pi\sqrt{17}\sum_{k=0}^{\infty}\frac{\left(-\frac{1}{17}\right)^k\left(-\frac{1}{2}\right)_k}{k!}\right)$$

$$e^{-\pi\sqrt{18}} = \exp\left(-\frac{\pi\sum_{j=0}^{\infty}\operatorname{Res}_{s=-\frac{1}{2}+j} 17^{-s}\,\Gamma\left(-\frac{1}{2}-s\right)\Gamma(s)}{2\sqrt{\pi}}\right)$$

Now, we have the following calculations:

$$e^{-6C+\phi} = 4096e^{-\pi\sqrt{18}}$$

$e^{-\pi\sqrt{18}}$ = 1.6272016… * 10^-6

from which:

$\frac{1}{4096}e^{-6C+\phi}$ = 1.6272016… * 10^-6

0.000244140625 $e^{-6C+\phi}$ = $e^{-\pi\sqrt{18}}$ = 1.6272016… * 10^-6

Now:

$$\ln\left(e^{-\pi\sqrt{18}}\right) = -13.328648814475 = -\pi\sqrt{18}$$

And:

(1.6272016* 10^-6) *1/ (0.000244140625)

Input interpretation:

$$\frac{1.6272016}{10^6} \times \frac{1}{0.000244140625}$$

Result:

0.0066650177536

0.006665017...

Thence:

$$0.000244140625\, e^{-6C+\phi} = e^{-\pi\sqrt{18}}$$

Dividing both sides by 0.000244140625, we obtain:

$$\frac{0.000244140625}{0.000244140625} e^{-6C+\phi} = \frac{1}{0.000244140625} e^{-\pi\sqrt{18}}$$

$$e^{-6C+\phi} = 0.0066650177536$$

((((exp((-Pi*sqrt(18)))))))*1/0.000244140625

Input interpretation:

$$\exp\left(-\pi\sqrt{18}\right) \times \frac{1}{0.000244140625}$$

Result:

0.00666501785...

0.00666501785…

Series representations:

$$\frac{\exp(-\pi\sqrt{18})}{0.000244141} = 4096\exp\left(-\pi\sqrt{17}\sum_{k=0}^{\infty}17^{-k}\binom{\frac{1}{2}}{k}\right)$$

$$\frac{\exp(-\pi\sqrt{18})}{0.000244141} = 4096\exp\left(-\pi\sqrt{17}\sum_{k=0}^{\infty}\frac{\left(-\frac{1}{17}\right)^{k}\left(-\frac{1}{2}\right)_{k}}{k!}\right)$$

$$\frac{\exp(-\pi\sqrt{18})}{0.000244141} = 4096\exp\left(-\frac{\pi\sum_{j=0}^{\infty}\operatorname{Res}_{s=-\frac{1}{2}+j}17^{-s}\,\Gamma\left(-\frac{1}{2}-s\right)\Gamma(s)}{2\sqrt{\pi}}\right)$$

Now:

$$e^{-6C+\phi} = 0.0066650177536$$

$$\exp\left(-\pi\sqrt{18}\right)\times\frac{1}{0.000244140625} =$$

$$e^{-\pi\sqrt{18}}\times\frac{1}{0.000244140625}$$

= 0.00666501785…

From:

ln(0.00666501784619)

Input interpretation:

$\log(0.00666501784619)$

Result:

$-5.010882647757\ldots$

-5.010882647757…

Alternative representations:

$$\log(0.006665017846190000) = \log_e(0.006665017846190000)$$

$$\log(0.006665017846190000) = \log(a)\log_a(0.006665017846190000)$$

$$\log(0.006665017846190000) = -\text{Li}_1(0.993334982153810000)$$

Series representations:

$$\log(0.006665017846190000) = -\sum_{k=1}^{\infty} \frac{(-1)^k (-0.993334982153810000)^k}{k}$$

$$\log(0.006665017846190000) = 2 i \pi \left\lfloor \frac{\arg(0.006665017846190000 - x)}{2 \pi} \right\rfloor + \log(x) - \sum_{k=1}^{\infty} \frac{(-1)^k (0.006665017846190000 - x)^k x^{-k}}{k} \quad \text{for } x < 0$$

$$\log(0.006665017846190000) = \left\lfloor \frac{\arg(0.006665017846190000 - z_0)}{2\pi} \right\rfloor \log\left(\frac{1}{z_0}\right) + \log(z_0) + \left\lfloor \frac{\arg(0.006665017846190000 - z_0)}{2\pi} \right\rfloor \log(z_0) - \sum_{k=1}^{\infty} \frac{(-1)^k (0.006665017846190000 - z_0)^k z_0^{-k}}{k}$$

Integral representation:

$$\log(0.006665017846190000) = \int_1^{0.006665017846190000} \frac{1}{t}\, dt$$

In conclusion:

$$-6C + \phi = -5.010882647757 \ldots$$

and for C = 1, we obtain:

$$\phi = -5.010882647757 + 6 = 0.989117352243 = \boldsymbol{\phi}$$

Note that the values of n_s (spectral index) 0.965, of the average of the Omega mesons Regge slope 0.987428571 and of the dilaton 0.989117352243, are also connected to the following two Rogers-Ramanujan continued fractions:

$$\frac{e^{-\frac{\pi}{5}}}{\sqrt{(\varphi-1)\sqrt{5}} - \varphi + 1} = 1 - \cfrac{e^{-\pi}}{1 + \cfrac{e^{-2\pi}}{1 + \cfrac{e^{-3\pi}}{1 + \cfrac{e^{-4\pi}}{1 + \ldots}}}} \approx 0.9568666373$$

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\cfrac{e^{-\pi\sqrt{5}}}{1+\cfrac{e^{-2\pi\sqrt{5}}}{1+\cfrac{e^{-3\pi\sqrt{5}}}{1+\cfrac{e^{-4\pi\sqrt{5}}}{1+\dots}}}}\approx 0.9991104684$$

(http://www.bitman.name/math/article/102/109/)

Also performing the 512th root of the inverse value of the Pion meson rest mass 139.57, we obtain:

((1/(139.57)))^1/512

Input interpretation:

$$\sqrt[512]{\frac{1}{139.57}}$$

Result:

0.99040073270864402755097375571330141546073279617855555 1684...

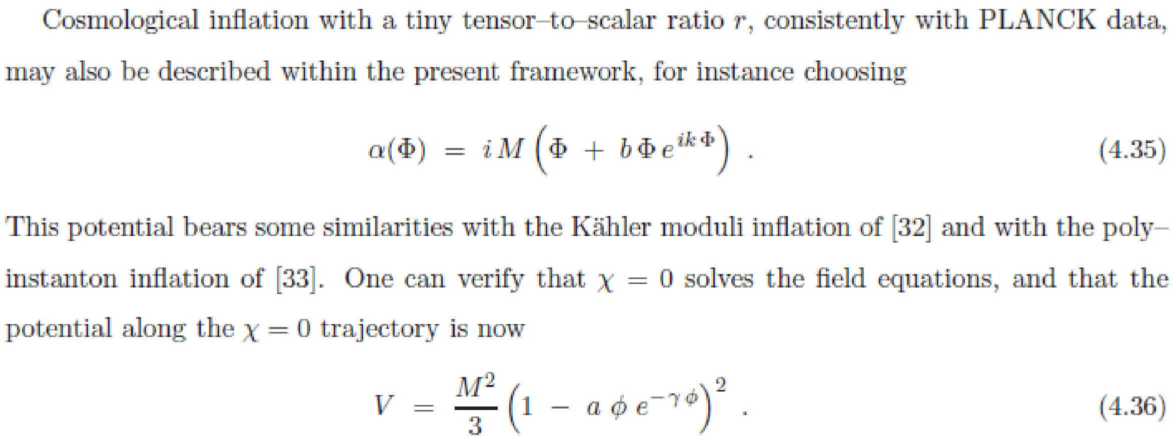
0.99040073.... result very near to the dilaton value 0.989117352243 = $\boldsymbol{\phi}$ and to the value of the following Rogers-Ramanujan continued fraction:

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\cfrac{e^{-\pi\sqrt{5}}}{1+\cfrac{e^{-2\pi\sqrt{5}}}{1+\cfrac{e^{-3\pi\sqrt{5}}}{1+\cfrac{e^{-4\pi\sqrt{5}}}{1+\dots}}}}\approx 0.9991104684$$

From

Properties of Nilpotent Supergravity - *E. Dudas, S. Ferrara, A. Kehagias and A. Sagnotti* - arXiv:1507.07842v2 [hep-th] 14 Sep 2015

We have that:



Cosmological inflation with a tiny tensor–to–scalar ratio r, consistently with PLANCK data, may also be described within the present framework, for instance choosing

$$\alpha(\Phi) \;=\; i\,M\left(\Phi \;+\; b\,\Phi\,e^{ik\,\Phi}\right) \;. \tag{4.35}$$

This potential bears some similarities with the Kähler moduli inflation of [32] and with the poly–instanton inflation of [33]. One can verify that $\chi = 0$ solves the field equations, and that the potential along the $\chi = 0$ trajectory is now

$$V \;=\; \frac{M^2}{3}\left(1 \;-\; a\,\phi\,e^{-\gamma\,\phi}\right)^2 \;. \tag{4.36}$$

We analyzing the following equation:

$$V \;=\; \frac{M^2}{3}\left(1 \;-\; a\,\phi\,e^{-\gamma\,\phi}\right)^2 \;.$$

$$\phi \;=\; \varphi \;-\; \frac{\sqrt{6}}{k} \;,$$

$$a \;=\; \frac{b\,\gamma}{e} \;<\; 0 \;, \qquad \gamma \;=\; \frac{k}{\sqrt{6}} \;<\; 0 \;.$$

We have:

(M^2)/3*[1-(b/euler number * k/sqrt6) * (φ- sqrt6/k) * exp(-(k/sqrt6)(φ- sqrt6/k))]^2

i.e.

V = (M^2)/3*[1-(b/euler number * k/sqrt6) * (φ- sqrt6/k) * exp(-(k/sqrt6)(φ- sqrt6/k))]^2

For k = 2 and φ = 0.9991104684, that is the value of the scalar field that is equal to the value of the following Rogers-Ramanujan continued fraction:

$$\frac{e^{-\frac{\pi}{\sqrt{5}}}}{\frac{\sqrt{5}}{1+\sqrt[5]{\sqrt{\varphi^5\sqrt[4]{5^3}}-1}}-\varphi+1}=1-\cfrac{e^{-\pi\sqrt{5}}}{1+\cfrac{e^{-2\pi\sqrt{5}}}{1+\cfrac{e^{-3\pi\sqrt{5}}}{1+\cfrac{e^{-4\pi\sqrt{5}}}{1+\ldots}}}}\approx 0.9991104684$$

we obtain:

V = (M^2)/3*[1-(b/euler number * 2/sqrt6) * (0.9991104684- sqrt6/2) * exp(-(2/sqrt6)(0.9991104684- sqrt6/2))]^2

Input interpretation:

$$V = \frac{M^2}{3}\left(1-\left(\frac{b}{e}\times\frac{2}{\sqrt{6}}\right)\left(0.9991104684-\frac{\sqrt{6}}{2}\right)\exp\left(-\frac{2}{\sqrt{6}}\left(0.9991104684-\frac{\sqrt{6}}{2}\right)\right)\right)^2$$

Result:

$$V = \frac{1}{3}\,(0.0814845\,b+1)^2\,M^2$$

Solutions:

$$b = \frac{225.913\left(-0.054323\,M^2 \pm 6.58545\times 10^{-10}\sqrt{M^4}\right)}{M^2} \quad (M \neq 0)$$

Alternate forms:

$$V = 0.00221324\,(b + 12.2723)^2\,M^2$$

$$V = 0.00221324\left(b^2\,M^2 + 24.5445\,b\,M^2 + 150.609\,M^2\right)$$

$$-0.00221324\,b^2\,M^2 - 0.054323\,b\,M^2 - \frac{M^2}{3} + V = 0$$

Expanded form:

$$V = 0.00221324\,b^2\,M^2 + 0.054323\,b\,M^2 + \frac{M^2}{3}$$

Alternate form assuming b, M, and V are positive:

$$V = 0.00221324\,(b + 12.2723)^2\,M^2$$

Alternate form assuming b, M, and V are real:

$$V = 0.00221324\,b^2\,M^2 + 0.054323\,b\,M^2 + 0.333333\,M^2 + 0$$

Derivative:

$$\frac{\partial}{\partial b}\left(\frac{1}{3}\,(0.0814845\,b+1)^2\,M^2\right)=0.054323\,(0.0814845\,b+1)\,M^2$$

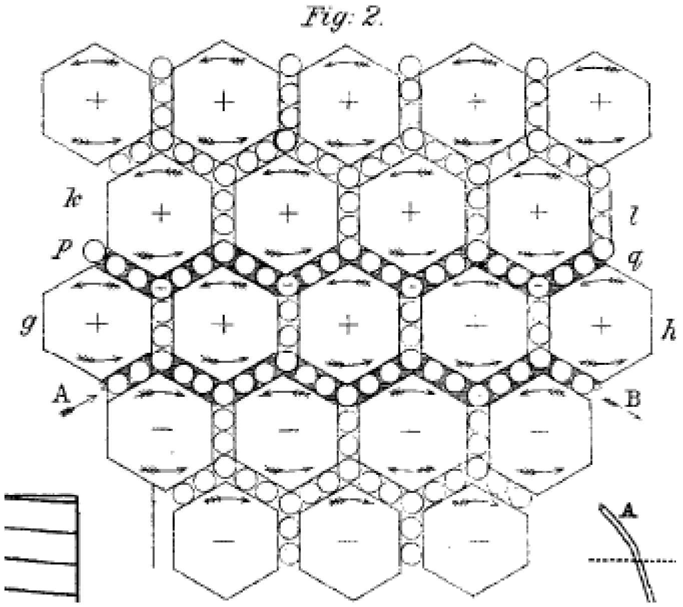
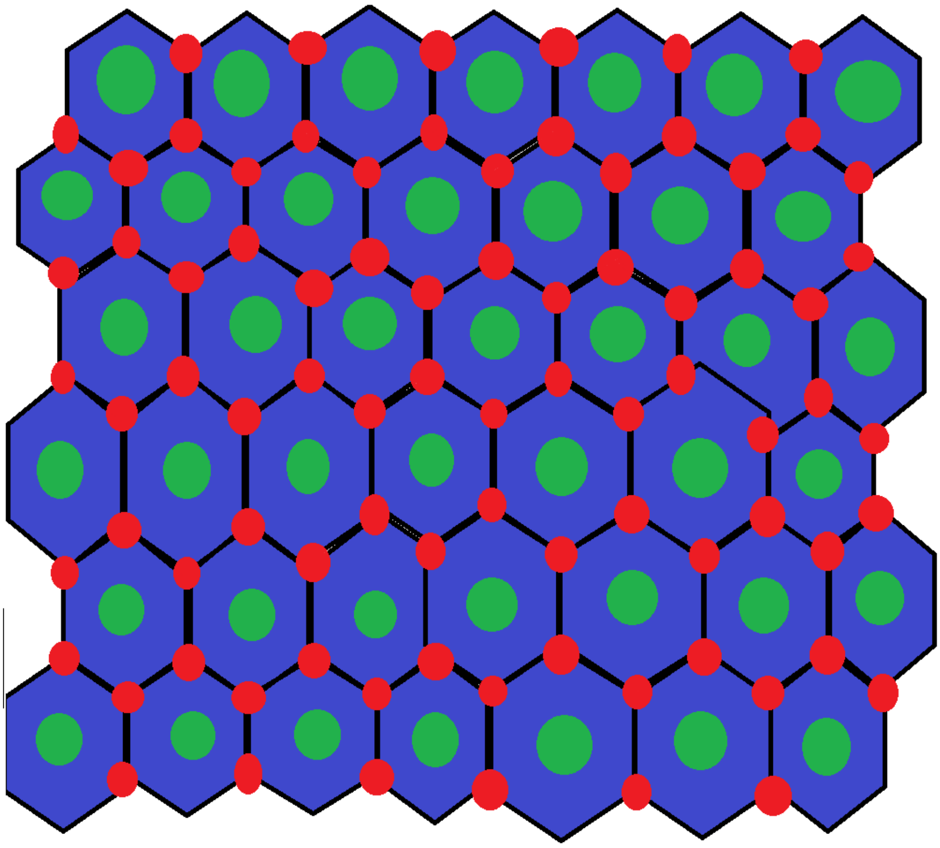
Fig. 1



It is therefore possible to consider the vortices of the "quantum vacuum" schematized as cubes or octahedrons (the + sign inside a given vortex indicates its counterclockwise rotation, while the - sign indicates its clockwise rotation). Between vortex and vortex there is a layer of "bubbles"-universes (or universes-spheres), which flows, as in the simplified two-dimensional drawing, from A to B

Fig. 2

Immagine dello Spazio-Tempo a scala quantistica: le cironferenze in rosso rappresentano i punti corrispondenti alle dimensioni compattificate e gli esagoni in blu, rappresentano le "fluttuazioni" (universi potenziali – cerchi verdi) del vuoto quantistico (2D)



Proposal

Image of space-time at quantum scale: the circles in red represent the points corresponding to the compactified dimensions and the hexagons in blue, represent the "fluctuations" (potential universes - green circles) of the quantum vacuum (2D). In reality, we will have n-dimensional hyperspheres in which the compactified dimensions "roll up" and octahedrons representing the "fluctuations", containing spheres (bubbles of potential universes), of the quantum vacuum

Fig. 3

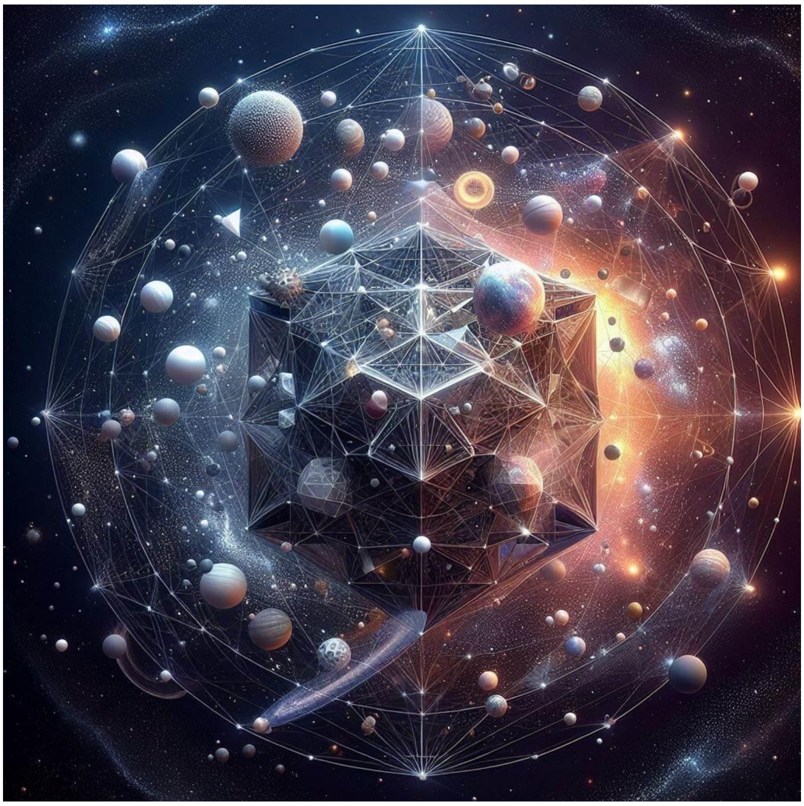


Image representing the solutions of the cubic equations in relation to the boundary conditions of the Plateau problem useful for understanding the formation of the bubbles of the eternally inflated universe and of an octahedron as a mathematical model of the primordial universe before the Big Bang, therefore highly symmetrical and with extremely low entropy. As for the cubic equations, they represent the geometric characteristics of the quantum vacuum, while the spherical surface would represent the geometry of the bubble of the universe.

Acknowledgments

We would like to thank Professor **Augusto Sagnotti** theoretical physicist at Scuola Normale Superiore (Pisa – Italy) for his very useful explanations and his availability.

I would like to thank also my son **Francesco Nardelli**, student of Educational Sciences, majoring in History and Philosophy, for his useful suggestions regarding the intriguing image at the end of this work

On the analysis of various Cubic Equations that can be solved with Cardano's Formula, Quartic Equations and Quintic Equations. New possible mathematical connections with the Ramanujan Recurring Numbers, DN Constant and some parameters of Number Theory and String Theory III

Michele Nardelli[1], Antonio Nardelli

Abstract

In this paper (part III), we analyze various Cubic Equations that can be solved with Cardano's formula, Quartic Equations and Quintic Equations. We obtain, new possible mathematical connections with the Ramanujan Recurring Numbers, DN Constant and some parameters of Number Theory and String Theory

Introduction

Cardano's method for cubic equations involves cube roots and introduces symmetry concepts. Similarly, string theory and M-theory involve symmetries and transformation groups that play a fundamental role in describing particles and interactions. Solutions of complete cubic equations via Cardano's method involve complex cube roots. Similarly, equations and solutions in superstring theory can often involve advanced algebraic and mathematical complexities. Solutions of cubic equations can be understood geometrically through topology and algebraic geometry. In string theory, the geometric and topological configurations of strings and branes are also central. Duality is an important concept in string theory, where different mathematical descriptions can be equivalent. Similarly, in solving cubic equations, duality links exist through cube roots.

Thus, in string theory, duality refers to the fact that different mathematical formulations or physical descriptions of a theory can be equivalent. For example, two seemingly different theories can be dual to each other, meaning they are two different ways of describing the same physical reality. This concept of duality has been very useful for understanding profound aspects of string theory and field theories.

Similarly, in solving cubic equations, duality can emerge through cube roots. The cubic equation $ax^3+bx^2+cx+d=0$ can be solved using cube roots, as in the Cardano method I described above. However, cube roots involve the concept of complex numbers, and it is sometimes possible to express the solutions in ways that highlight a duality between the solutions.

For example, if we consider complex cube roots, we can see a duality between them, since there are connections via the cube roots of unity. This duality is similar to the concept of duality in string theory, where different descriptions can be connected by similar transformations.

In both cases, duality provides a deeper way of understanding the underlying mathematical or physical structure, allowing you to explore hidden connections between different concepts.

Cubic surfaces can be associated with geometric and topological concepts. In string theory, for example, some models require spaces with particular shapes, and the geometry of the spaces can influence the properties of strings and particles. Some mathematical and physical models involving surfaces might be described by cubic or

complex equations. The geometry of surfaces and the associated mathematical structure can influence the properties of universe bubbles in the multiverse. Cubic surfaces can represent certain topological spaces, and their properties can affect the structure of the associated string theory.

The connection between the surface of a D-brane and the roots of a cubic equation can be explored in specific contexts within string theory, especially when it comes to studying the geometric and topological properties of D-branes. D-branes are extended objects on whose surface open strings can terminate. The geometry of the D-brane surface can interfere with the physics of surrounding strings. In some cases, geometry can be described mathematically through objects known in algebraic surface theory, such as cubic equations.

D-branes can host open fields, which describe particles interacting with the D-brane. Field equations on a D-brane can involve surface geometry, and in some situations, these equations can be associated with higher degree algebraic equations, such as cubic equations.

The compactification of extra dimensions, which is an important part of string theory, can be associated with the surface geometry of a D-brane. Compactification can lead to a reduction in dimensions and a geometric description that can involve algebraic equations, including cubic equations.

The topological invariants associated with the surface of a D-brane, such as the Betti number or the Chern number, can be related to geometric characteristics that can be described via algebraic equations, including cubic equations.

In some situations of duality, the description of a D-brane in a context can be dualistic to a description based on algebraic objects such as curves or surfaces, which can be represented via algebraic equations, including cubic equations.

In this paper, we will hypothesize that the solutions of the cubic equations can be used as boundary conditions to further the understanding of the formation of universe bubbles in eternal inflation. Furthermore, an octahedron could serve as a mathematical or conceptual model of the universe in the pre-Big Bang phase. Cubic equations, in this context, could represent the geometric characteristics of the quantum vacuum, while the spherical surface could be used to describe the geometry of the universe bubble.

The results (2√2)/π, the golden ratio φ and π obtained, can be connected to the proposed cosmological model. Here's how they might be connected:

Ratio (2√2)/π:

This relationship may have a connection with the geometric properties of the octahedron and the sphere, which have been considered as mathematical models of the early universe and universe bubbles in eternal inflation. It may reflect a fundamental relationship between the geometry of solids and the mathematical characteristics of solutions to cubic equations.

Golden Ratio φ:

The golden ratio is a mathematical constant that appears in many natural and artistic contexts and is often associated with harmonious proportions and aesthetic beauty. Its emergence in this context could suggest a kind of intrinsic symmetry or harmony in the structure of the early universe and universe bubbles.

Value of π:

The value of π is a fundamental mathematical constant that appears in many geometric formulas and relationships, including the geometry of the sphere. Its appearance could indicate a direct connection between the geometry of universe bubbles and the mathematical properties of spherical surfaces.

Ultimately, the results obtained can be interpreted as manifestations of the geometric and mathematical properties of the models proposed for the early universe and universe bubbles. This suggests that there is a profound connection between geometry, mathematics and cosmological physics, and that through the analysis of these relationships we can deepen our understanding of the universe and its fundamental phenomena.

Finally, it is also possible to hypothesize the solutions of Ramanujan's cubic equations which are related to the cubic equations solvable with the Cardano method and Padovan's recurrence relations, as boundary conditions to deepen the understanding of the formation of inflationary universe bubbles eternal and of an octahedron which could represent a mathematical or conceptual model of the primordial universe before the Big Bang. Furthermore, regarding the cubic equations, they can represent the geometric characteristics of the quantum vacuum, while the spherical surface represents the geometry of the universe bubble. The results above $(2\sqrt{2})/\pi$, the golden ratio φ and π which are obtained, can be connected to the proposed cosmological model. This hypothesis is certainly plausible.

These mathematical solutions and relationships can be seen as representations of the principles and laws that govern the formation and evolution of the universe. The cubic equations, in this context, could reflect the geometric and dynamic characteristics of the quantum vacuum, while the spherical surface could represent the geometry of the bubbles of the universe.

Regarding fundamental mathematical values, they could emerge as a consequence of the geometric and physical laws that govern the structure and evolution of the primordial universe and universe bubbles.

The multidisciplinary approach involving complex mathematical solutions and cosmological concepts can offer deeper insight into the fundamental nature of the universe and its processes. Exploring these connections could lead to new discoveries and insights into our understanding of the early universe and its complexity.

We will also give an example of how the result of multiplying the solutions of a quartic equation for the formula involving the ratios between the volumes of geometric solids and the Del Gaudio-Nardelli Constant approaches the values of the golden ratio and Pi, and as from the product of the solutions, the Recurring Numbers of Ramanujan are obtained. This discovery suggests that there are still many connections to be explored between mathematics and physics, and that these connections could lead to new insights into the nature of the universe and its fundamental laws.

Cubic equations and Cardano's Formulas

We analyze the following equation

$$x^3 + 26x = 12x^2 + 12.$$

i.e.

$$x^3 - 12x^2 + 26x - 12 = 0$$

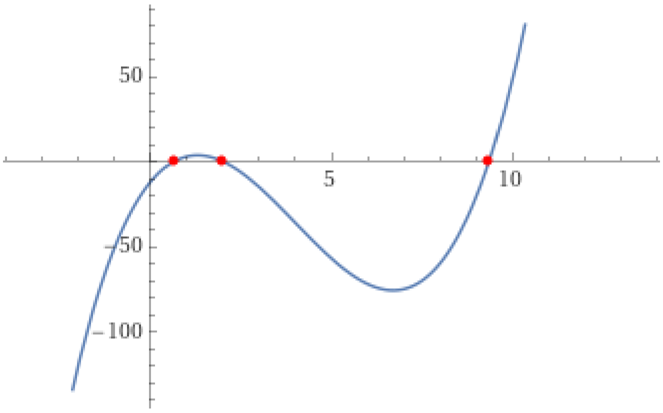
We obtain:

x^3-12x^2+26x-12=0

Input

$x^3 - 12x^2 + 26x - 12 = 0$

Root plot **(figure that can be related to an open string)**



Alternate forms

$(x-2)((x-10)x+6)=0$

$(x-2)\left(x^2-10x+6\right)=0$

$(x-4)^3-22(x-4)-36=0$

Solutions

$x=2$

$x=5-\sqrt{19}$

$x=5+\sqrt{19}$

Sum of roots

12

Product of roots

12

From

$$ax^3 + bx^2 + cx + d = 0$$

The Cardano's Formula is:

$$x = \sqrt[3]{-\frac{b^3}{27a^3}+\frac{bc}{6a^2}-\frac{d}{2a}+\sqrt{\left(-\frac{b^3}{27a^3}+\frac{bc}{6a^2}-\frac{d}{2a}\right)^2+\left(\frac{c}{3a}-\frac{b^2}{9a^2}\right)^3}}$$
$$+\sqrt[3]{-\frac{b^3}{27a^3}+\frac{bc}{6a^2}-\frac{d}{2a}-\sqrt{\left(-\frac{b^3}{27a^3}+\frac{bc}{6a^2}-\frac{d}{2a}\right)^2+\left(\frac{c}{3a}-\frac{b^2}{9a^2}\right)^3}}-\frac{b}{3a}$$

From

$$x^3 - 12x^2 + 26x - 12 = 0$$

We obtain:

(((12^3)/(27)+(-12*26)/(6)+(12)/(2)+sqrt(((12^3)/(27)+(-12*26)/(6)+(12)/(2))^2+((26)/(3)-(12^2)/(9))^3)))^1/3

Input

$$\sqrt[3]{\frac{12^3}{27}+\frac{1}{6}(-12\times 26)+\frac{12}{2}+\sqrt{\left(\frac{12^3}{27}+\frac{1}{6}(-12\times 26)+\frac{12}{2}\right)^2+\left(\frac{26}{3}-\frac{12^2}{9}\right)^3}}$$

Alternate forms

$$\frac{1}{3}\left(\sqrt[3]{6\left(81-5\,i\,\sqrt{57}\right)}+\sqrt[3]{6\left(81+5\,i\,\sqrt{57}\right)}+12\right)$$

$$5+\sqrt{19}$$

$$4+2\sqrt{\frac{22}{3}}\cos\left(\frac{1}{3}\tan^{-1}\left(\frac{5\sqrt{\frac{19}{3}}}{27}\right)\right)$$

$\tan^{-1}(x)$ is the inverse tangent function

Minimal polynomial

$$x^2-10\,x+6$$

The minimal polynomial of α is the irreducible polynomial with rational coefficients of smallest degree with α as a root »

We have the following expression concerning the ratios (and/or the inverses) between the icosahedron, octahedron and tetrahedron volumes and the sphere volume.

$$\sqrt[2\pi]{\frac{\frac{5}{12}\left(3+\sqrt{5}\right)d^3}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}\times\frac{1}{\frac{\frac{1}{3}\sqrt{2}a^3}{\frac{4}{3}\pi\left(\frac{a}{2}\right)^3}}\times\frac{1}{\frac{\sqrt{2}}{12}d^3\cdot\frac{1}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}}}$$

(we have highlighted the DN Constant in blue)

From the above expression, we obtain the following formulas concerning the icosahedron, octahedron and tetrahedron volumes together to the sphere volume.

$$\sqrt[2\pi]{\frac{5}{12}(3+\sqrt{5})d^3\times\left(\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\right)^2}$$

and

$$\sqrt[2\pi]{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\times\frac{1}{3}\sqrt{2}d^3\times\frac{\sqrt{2}}{12}d^3}$$

From the alternate form

$$\frac{1}{3}\left(\sqrt[3]{6\left(81-5\,i\,\sqrt{57}\right)}+\sqrt[3]{6\left(81+5\,i\,\sqrt{57}\right)}+12\right)$$

we obtain:

((1/3 ((6 (81 - 5 i sqrt(57)))^(1/3) + (6 (81 + 5 i sqrt(57)))^(1/3) + 12))) ((5/12 (3+√5) d^3)×((4/3 π(d/2)^3)^2))^(1/(2Pi))

Input

$$\left(\frac{1}{3}\left(\sqrt[3]{6\left(81-5\,i\,\sqrt{57}\right)}+\sqrt[3]{6\left(81+5\,i\,\sqrt{57}\right)}+12\right)\right)\sqrt[2\pi]{\left(\frac{5}{12}\left(3+\sqrt{5}\right)d^3\right)\left(\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\right)^2}$$

i is the imaginary unit

$0.9003163161571\ldots. = \frac{2\sqrt{2}}{\pi}$ (DN Constant)

Possible closed form

$$\frac{2\sqrt{2}}{\pi}\approx 0.90031631615 7$$

Now, we analyze the following quintic polynomial

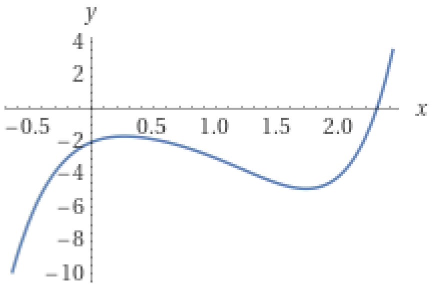
$$x^5 - 4x^4 + 7x^3 - 8x^2 + 3x - 2$$

x^5−4x^4+7x^3−8x^2+3x−2

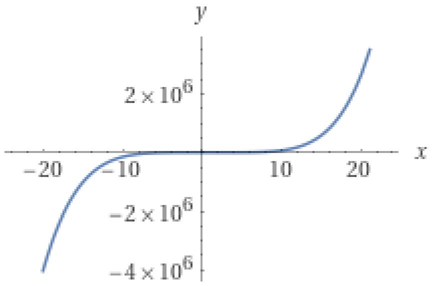
Input

$$x^5 - 4x^4 + 7x^3 - 8x^2 + 3x - 2$$

Plots (figures that can be related to the open strings)



(x from −0.6 to 2.4)



(x from −24 to 24)

Alternate form

$$x(x(x((x-4)x+7)-8)+3)-2$$

Real root

$$x = \boxed{\text{root of } x^5 - 4x^4 + 7x^3 - 8x^2 + 3x - 2 \text{ near } x = 2.29209}$$

Complex roots

$$x \approx 0.07713 - 0.58620\,i$$

$x \approx 0.07713 + 0.58620\, i$

$x \approx 0.7768 - 1.3757\, i$

$x \approx 0.7768 + 1.3757\, i$

Polynomial discriminant

$\Delta = 117312$

Properties as a real function

Domain

$\mathbb{R}$ (all real numbers)

Range

$\mathbb{R}$ (all real numbers)

Surjectivity

surjective onto $\mathbb{R}$

$\mathbb{R}$ is the set of real numbers

Derivative

$$\frac{d}{dx}\left(x^5 - 4x^4 + 7x^3 - 8x^2 + 3x - 2\right) = 5x^4 - 16x^3 + 21x^2 - 16x + 3$$

Indefinite integral

$$\int (x^5 - 4x^4 + 7x^3 - 8x^2 + 3x - 2)\, dx = \frac{x^6}{6} - \frac{4x^5}{5} + \frac{7x^4}{4} - \frac{8x^3}{3} + \frac{3x^2}{2} - 2x + \text{constant}$$

Local maximum

$\max\{x^5 - 4x^4 + 7x^3 - 8x^2 + 3x - 2\} \approx -1.6549$ at $x \approx 0.26015$

Local minimum

$\min\{x^5 - 4x^4 + 7x^3 - 8x^2 + 3x - 2\} \approx -4.8430$ at $x \approx 1.7230$

From the derivative result

$$\frac{d}{dx}(x^5 - 4x^4 + 7x^3 - 8x^2 + 3x - 2) = 5x^4 - 16x^3 + 21x^2 - 16x + 3$$

we obtain:

5 x^4 - 16 x^3 + 21 x^2 - 16 x + 3

Input

$5x^4 - 16x^3 + 21x^2 - 16x + 3$

Plots (figures that can be related to the open strings)

$2x(2x(5x - 12) + 21) - 16$

Real root

$$x = \frac{1}{5}\left(4 - \frac{3^{2/3}}{\sqrt[3]{2\left(12 + 5\sqrt{6}\right)}} + \frac{\sqrt[3]{3\left(12 + 5\sqrt{6}\right)}}{2^{2/3}}\right)$$

Complex roots

$$x = \frac{4}{5} + \frac{3^{2/3}}{10 \sqrt[3]{2\left(12 + 5\sqrt{6}\right)}} - \frac{\sqrt[3]{3\left(12 + 5\sqrt{6}\right)}}{10 \times 2^{2/3}} + i\left(-\frac{3^{5/6}\sqrt[3]{12 + 5\sqrt{6}}}{10 \times 2^{2/3}} - \frac{3\sqrt[6]{3}}{10 \sqrt[3]{2\left(12 + 5\sqrt{6}\right)}}\right)$$

$$x = \frac{4}{5} + \frac{3^{2/3}}{10 \sqrt[3]{2\left(12 + 5\sqrt{6}\right)}} - \frac{\sqrt[3]{3\left(12 + 5\sqrt{6}\right)}}{10 \times 2^{2/3}} + i\left(\frac{3^{5/6}\sqrt[3]{12 + 5\sqrt{6}}}{10 \times 2^{2/3}} + \frac{3\sqrt[6]{3}}{10 \sqrt[3]{2\left(12 + 5\sqrt{6}\right)}}\right)$$

Polynomial discriminant

$\Delta = -93312$

Properties as a real function

Domain

$\mathbb{R}$ (all real numbers)

Range

$\mathbb{R}$ (all real numbers)

Bijectivity

bijective from its domain to $\mathbb{R}$

$\mathbb{R}$ is the set of real numbers

Derivative

$$\frac{d}{dx}\left(20\,x^3-48\,x^2+42\,x-16\right)=60\,x^2-96\,x+42$$

Indefinite integral

$$\int\left(20\,x^3-48\,x^2+42\,x-16\right)dx=5\,x^4-16\,x^3+21\,x^2-16\,x+\text{constant}$$

Now, from the real root

$$x=\frac{1}{5}\left(4-\frac{3^{2/3}}{\sqrt[3]{2\left(12+5\sqrt{6}\right)}}+\frac{\sqrt[3]{3\left(12+5\sqrt{6}\right)}}{2^{2/3}}\right)$$

we obtain:

1+1/(Pi((1/5 (4 - 3^(2/3)/(2 (12 + 5 sqrt(6)))^(1/3) + (3 (12 + 5 sqrt(6)))^(1/3)/2^(2/3)))))^1/3

Input

$$1+\frac{1}{\sqrt[3]{\pi\left(\frac{1}{5}\left(4-\frac{3^{2/3}}{\sqrt[3]{2\left(12+5\sqrt{6}\right)}}+\frac{\sqrt[3]{3\left(12+5\sqrt{6}\right)}}{2^{2/3}}\right)\right)}}$$

Exact result

$$1+\sqrt[3]{\frac{5}{\left(4-\frac{3^{2/3}}{\sqrt[3]{2\left(12+5\sqrt{6}\right)}}+\frac{\sqrt[3]{3\left(12+5\sqrt{6}\right)}}{2^{2/3}}\right)\pi}}$$

Decimal approximation

1.6404209871473183806591285327332348601656401792367466435736463983
…

1.64042098714…≈ $\zeta(2) = \pi^2/6 = 1.644934$ (trace of the instanton shape and Ramanujan Recurring Number)

Property

$$1+\sqrt[3]{\frac{5}{\left(4-\frac{3^{2/3}}{\sqrt[3]{2\left(12+5\sqrt{6}\right)}}+\frac{\sqrt[3]{3\left(12+5\sqrt{6}\right)}}{2^{2/3}}\right)\pi}}$$ is a transcendental number

Alternate forms

$$1+\sqrt[3]{\frac{10}{\left(8-\frac{6^{2/3}}{\sqrt[3]{12+5\sqrt{6}}}+\sqrt[3]{72+30\sqrt{6}}\right)\pi}}$$

$$\frac{1+\left(\frac{10\left(12+5\sqrt{6}\right)}{\left(96+40\sqrt{6}+5\times 6^{5/6}\sqrt[3]{12+5\sqrt{6}}+12\sqrt[3]{6\left(12+5\sqrt{6}\right)}-\left(6\left(12+5\sqrt{6}\right)\right)^{2/3}\right)\pi}\right)\text{^}(1/3)}{2^{2/9}\left(\left(5\ \boxed{\text{root of } x^6-24x^3-6 \text{ near } x=2.89438}\right)\Big/\left(\pi\left(\sqrt[3]{3}\left(\boxed{\text{root of } x^6-588x^3+36 \text{ near } x=8.37743}-\sqrt[3]{6}\right)+4\times 2^{2/3}\ \boxed{\text{root of } x^6-24x^3-6 \text{ near } x=2.89438}\right)\right)\right)\text{^}(1/3)+1}$$

We have the following expression concerning the ratios (and/or the inverses) between the icosahedron, octahedron and tetrahedron volumes and the sphere volume.

$$\sqrt[2\pi]{\frac{\frac{5}{12}(3+\sqrt{5})d^3}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}\times\frac{1}{\frac{\frac{1}{3}\sqrt{2}a^3}{\frac{4}{3}\pi\left(\frac{a}{2}\right)^3}}\times\frac{1}{\frac{\sqrt{2}}{12}d^3\cdot\frac{1}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}}}$$

(we have highlighted the DN Constant in blue)

From the above expression, we obtain the following formulas concerning the icosahedron, octahedron and tetrahedron volumes together to the sphere volume.

$$\sqrt[2\pi]{\frac{5}{12}\left(3+\sqrt{5}\right)d^3\times\left(\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\right)^2}$$

and

$$\sqrt[2\pi]{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\times\frac{1}{3}\sqrt{2}d^3\times\frac{\sqrt{2}}{12}d^3}$$

From the real root

$$x=\frac{1}{5}\left(4-\frac{3^{2/3}}{\sqrt[3]{2\left(12+5\sqrt{6}\right)}}+\frac{\sqrt[3]{3\left(12+5\sqrt{6}\right)}}{2^{2/3}}\right)$$

we obtain:

((1/5 (4 - 3^(2/3)/(2 (12 + 5 sqrt(6)))^(1/3) + (3 (12 + 5 sqrt(6)))^(1/3)/2^(2/3)))) ((5/12 (3+√5) d^3)×((4/3 π(d/2)^3)^2))^(1/(2Pi))

Input

$\min\{4(55-616x+2112x^2-2816x^3+1280x^4)\} \approx -24.137$ at $x \approx 0.25869$

Again, from the derivative result

$$\frac{d}{dx}(4(55-616x+2112x^2-2816x^3+1280x^4)) = 32(640x^3-1056x^2+528x-77)$$

$$32(-77+528x-1056x^2+640x^3)$$

we obtain:

32 (-77 + 528 x - 1056 x^2 + 640 x^3)

Input

$$32(-77+528x-1056x^2+640x^3)$$

Plots (figures that can be related to the open strings)

$\Delta = 392\,886\,428\,368\,896$

Properties as a real function

Domain

$\mathbb{R}$ (all real numbers)

Range

$\mathbb{R}$ (all real numbers)

Surjectivity

surjective onto ℝ

ℝ is the set of real numbers

Derivative

$$\frac{d}{dx}\left(32\left(-77+528\,x-1056\,x^2+640\,x^3\right)\right)=1536\left(40\,x^2-44\,x+11\right)$$

Indefinite integral

$$\int 32\left(-77+528\,x-1056\,x^2+640\,x^3\right)dx=$$
$$32\left(160\,x^4-352\,x^3+264\,x^2-77\,x\right)+\text{constant}$$

Local maximum

$$\max\left\{32\left(-77+528\,x-1056\,x^2+640\,x^3\right)\right\}=\frac{352}{25}\left(1+4\sqrt{11}\right)\text{ at }x=\frac{11}{20}-\frac{\sqrt{11}}{20}$$

Local minimum

$$\min\left\{32\left(-77+528\,x-1056\,x^2+640\,x^3\right)\right\}=-\frac{352}{25}\left(4\sqrt{11}-1\right)\text{ at }x=\frac{11}{20}+\frac{\sqrt{11}}{20}$$

Definite integrals

$$\int_{\text{root of } -77+528x-1056x^2+640x^3 \text{ near } x=0.258693}^{\text{root of } -77+528x-1056x^2+640x^3 \text{ near } x=0.55834} 32\left(-77+528x-1056x^2+640x^3\right) dx = \frac{33}{125}\sqrt{\left(6\left(2024+\frac{93104}{\sqrt[3]{\frac{1}{11}\left(-3206193+3002125\,i\sqrt{7}\right)}}+11^{2/3}\sqrt[3]{-3206193+3002125\,i\sqrt{7}}\right)\right)} \approx 38.9798$$

$$\int_{\text{root of } -77+528x-1056x^2+640x^3 \text{ near } x=0.55834}^{\text{root of } -77+528x-1056x^2+640x^3 \text{ near } x=0.832967} 32\left(-77+528x-1056x^2+640x^3\right) dx = \frac{33}{125}(-1)^{3/4}\sqrt{\left(3\left(4048\,i-\frac{93104\,i}{\sqrt[3]{\frac{1}{11}\left(-3206193+3002125\,i\sqrt{7}\right)}}-\frac{93104\sqrt{3}}{\sqrt[3]{\frac{1}{11}\left(-3206193+3002125\,i\sqrt{7}\right)}}-i\,11^{2/3}\sqrt[3]{-3206193+3002125\,i\sqrt{7}}+\sqrt{3}\;11^{2/3}\sqrt[3]{-3206193+3002125\,i\sqrt{7}}\right)\right)} \approx -30.8923$$

We have the following expression concerning the ratios (and/or the inverses) between the icosahedron, octahedron and tetrahedron volumes and the sphere volume.

$$\sqrt[2\pi]{\frac{\frac{5}{12}(3+\sqrt{5})d^3}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3} \times \frac{1}{\frac{\frac{1}{3}\sqrt{2}a^3}{\frac{4}{3}\pi\left(\frac{a}{2}\right)^3}} \times \frac{1}{\frac{\sqrt{2}}{12}d^3 \cdot \frac{1}{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3}}}$$

(we have highlighted the DN Constant in blue)

From the above expression, we obtain the following formulas concerning the icosahedron, octahedron and tetrahedron volumes together to the sphere volume.

$$\sqrt[2\pi]{\frac{5}{12}(3+\sqrt{5})d^3 \times \left(\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\right)^2}$$

and

$$\sqrt[2\pi]{\frac{4}{3}\pi\left(\frac{d}{2}\right)^3 \times \frac{1}{3}\sqrt{2}d^3 \times \frac{\sqrt{2}}{12}d^3}$$

From the following root

$$x = \frac{1}{20}\left(11 + \frac{22^{2/3}}{\sqrt[3]{-1+5\,i\,\sqrt{7}}} + \frac{\sqrt[3]{11\left(-1+5\,i\,\sqrt{7}\right)}}{2^{2/3}}\right)$$

we obtain:

((1/20 (11 + 22^(2/3)/(-1 + 5 i sqrt(7))^(1/3) + (11 (-1 + 5 i sqrt(7)))^(1/3)/2^(2/3)))) ((5/12 (3+√5) d^3)×((4/3 π(d/2)^3)^2))^(1/(2Pi))

Input

$$\left(\frac{1}{20}\left(11+\frac{22^{2/3}}{\sqrt[3]{-1+5\,i\sqrt{7}}}+\frac{\sqrt[3]{11\left(-1+5\,i\sqrt{7}\right)}}{2^{2/3}}\right)\right)\sqrt[2\pi]{\left(\frac{5}{12}\left(3+\sqrt{5}\right)d^3\right)\left(\frac{4}{3}\pi\left(\frac{d}{2}\right)^3\right)^2}$$

i is the imaginary unit

Exact result

$$3^{-3/(2\pi)}\times 4^{-1-1/\pi}\times 5^{1/(2\pi)-1}\sqrt[2\pi]{3+\sqrt{5}}\left(11+\frac{22^{2/3}}{\sqrt[3]{-1+5\,i\sqrt{7}}}+\frac{\sqrt[3]{11\left(-1+5\,i\sqrt{7}\right)}}{2^{2/3}}\right)\sqrt[\pi]{\pi}\sqrt[2\pi]{d^9}$$
